Borrow, George, an English author, was born in Norfolk in 1803. While a lad he lived much among gipsies near Norwich, and acquired a minute acquaintance with their habits and language. He was originally intended to be a solicitor, but abandoned the profession for literary work in London. In 1833 he became an agent for the British and Foreign Bible Society, and in this capacity visited many countries, including Russia and Spain, in the latter incurring considerable personal risk, and being twice imprisoned for endeavouring to circulate the Bible. During his stay there, he mixed with the Zingali or gipsies, and in 1841, after he had retired from the service of the Society, he published an account of them which attracted very considerable attention, and in which he endeavoured to show that their language was intimately connected with the Sanskrit. This was followed in 1842 by his still more celebrated *Bible in Spain*. B. pursued his researches into the habits of gipsies in 1844, especially in Hungary, Wallachia, and Turkey. In 1851 appeared his *Lavengro*, which is partly an autobiography; in 1857 the *Romany Rye*; in 1862 *Wild Wales*; in 1874 *Romano Lavo-til*. B. has contributed to periodical literature both in prose and in verse, and has translated portions of the Scriptures into various languages, including the Zingali and the Manchu or Chinese-Tartar.

Borrowing. Some difficulty has been found in giving a legal definition to this term. A great legal authority has defined it as the reception of something *lent*, on the view that that which an owner puts into the hands of another, for the benefit or convenience of the owner alone, is not *lent*, but deposited. Where there is a lender, therefore, there must be a borrower. It does not, however, seem to us correct to say that B. is necessarily gratuitous, or even *principally* for the use or advantage of him who borrows. C borrows a sum of money from D at 5 per cent. Here D presumably has as much advantage from the loan as C has. Where an article is deposited with any one, or intrusted to him solely for the convenience of the depositor, no liability for loss or damage is morally or legally incurred by the person so trusted, even though that loss or damage come through his negli-

gence. Thus, if A ask B to buy him a watch in Paris and bring it to London gratuitously, and B buys it and loses it on the way to London, A must pay to B the full price of the watch. B cannot be supposed gratuitously to run the risk even of his own carelessness. If, however, B asks A to lend him gratuitously anything, say a horse, he is then liable not only for the consequences of his own carelessness, but for the consequences of accident while in his custody. Regarding Hire (q. v.) the law is different. Were A to ask B as a favour to ride his horse for him, this would entirely exonerate B from the consequences of accident; but were B in this case to lend A's horse to D, without A's knowledge or consent, B would incur liability to A; because loan merely infers right of personal use, not even a temporary right of property.

Borrowstownness', or Bo'ness', a town in Linlithgowshire, on the S. coast of the Firth of Forth, 17 miles W.N.W. of Edinburgh, and 3 N. of Linlithgow, with some manufactures of salt, vitriol, soap, malt, and earthenware. It is a station on the Monkland Railway, has extensive coal-mines, and lies in a district rich in iron, limestone, and freestone. In the 17th c. it ranked next to Leith among Scottish ports, but its trade is now chiefly coasting. B. registered, in 1874, 27 vessels of 3349 tons; in 1873, 647 vessels of 68,897 tons entered the port, and 1527 of 169,815 tons cleared. A portion of the Roman wall of Antoninus, known as Graham's Dyke, is still seen here. Pop. (1871) 4256.

Borsad, a town in the executive district of Kaira, province of Bombay, N. Division, about midway between Baroda and Ahmedabad, and distant from each about 40 miles. It lies in the elevated region of Gujerat, which is upwards of 1900 feet above the sea-level, and which is traversed by the Bombay and Baroda Railway. Pop. (1872) 12,214.

Bort, or Boart, dark-grey or black lustreless diamonds found in the Brazilian mines. They are also called *carbonado* or anthracitic diamonds, and possessing the hardness of the precious mineral, they are used for diamond rock-boring drills, for machines used to dress millstones, and other stone-cutting apparatus.

Borwad, a town in the district of Kandesh, province of Bombay, Br. India, about 100 miles N.E. of Bombay city, with a pop. (1872) of 5197.

Bory de Saint-Vincent, Jean Baptiste George Marie, a celebrated French naturalist and author, was born at Agen (Lot-et-Garonne), in 1780. In 1800 he accompanied Captain Baudin on a scientific expedition to New Holland, and after his return home served at Austerlitz and Ulm, and was one of Soult's staff in the Peninsula. He served as a colonel at Waterloo, after which, on the ascension of the Bourbons, he was forced into exile. Returning to Paris in 1820, he applied himself chiefly to literary and scientific work; superintended the scientific expedition to the Morea and the Cyclades, the account of which he gave in his *Expedition Scientifique de Morée* (Par. 1832). B. died December 22, 1846. His chief works are his *Annales des Sciences Physiques* (8 vols., edited at Brussels during his exile), his *Traité de L'Homme* (1827), and accounts of his various travels, scientific and otherwise, which he undertook.

Bor'zna, or Borzna, the capital of a circle of the same name, government of Tchernigov, Russia, 25 miles N.E. of Ujeschia, is a station on the Moscow Railway. Pop. 7231.

Bos. See BOVIDÆ and Ox.

Bos, Lambert, a Dutch philologist, was born at Workum, Friesland, 23d November 1670. He studied Greek at the University of Franeker, was chosen reader in Greek there 1697, and professor 1704. He died 6th January 1717. B.'s works are now seldom consulted. His *Ellipser Græca* (Franeker, 1702) was reprinted at Glasgow in 1813, with dissertations by Weiske and Hermann. Other works of B. are the *Vetus Testamentum* (Franeker, 1709) and *Antiquitatum Græcarum Descriptio brevis* (Franeker, 1714; Leips. 1749).

Bo'sa, a finely situated but unhealthy town in the province of Cagliari, Sardinia, a few miles from the W. coast, on a river of the same name (Lat. *Temus*), possesses an old castle, a cath-

dral, and several monasteries. It has a trade in wine, oil, grain, and cheese. Pop. 6403.

Boscan-Almoga'ver, Juan, a Spanish poet, of patrician descent, born at Barcelona about 1500. After spending some time at the court of Charles V., he retired to Barcelona, where he died in 1544. B. revolutionised Spanish poetry by clothing it in Italian forms. His hendecasyllabic version of *Hero and Leander* is much admired for its elegance and purity. B.'s works, with those of Garcilasso de la Vega (*Las Obras de B. y Algunas de Garcilasso de la Vega*), were published at Lisbon in 1543, and at Leon in 1549.

Boscawen, Edward, a distinguished British commander, second son of Hugh B., first Viscount Falmouth, was born August 19, 1711, in Cornwall. He entered the navy, early distinguishing himself at Puerto-Bello and Carthage, and, under Anson, took part in the battle of Finisterre, 1747. He was made rear-admiral, and sent with a squadron to the E. Indies, when, although he failed in an attempt upon Pondicherry, he succeeded in taking Madras. B. crowned a series of daring exploits in the war with the French by gaining a great victory over the Toulon fleet in the Bay of Lagos in 1759. For his services he received the thanks of Parliament, the rank of general of marines, and a pension of £3000 a year. He died 10th January 1761.

Bosch, Hieronymus de, born at Amsterdam, 23d March 1740. His favourite study was Latin poetry, and his own compositions in Latin verse have not been equalled since. In 1800 he was appointed curator of the University of Leyden, where he died, 1st June 1811. B.'s best works are his *Poemata* (Leyd. 1803; 2d ed. Utrecht. 1808) and his *Anthologia Græca* (4 vols. Utrecht. 1795-1810; Lennep, 1822), accompanied by a metrical version of Grotius not previously printed.

Bos'cobel, an extra-parochial district in the Shiffnal division of the hundred of Brimstree in Shropshire. In B. House, which was then occupied by Thomas Penderell, a farmer, and his four brothers, Charles II. took refuge after his defeat at Worcester in 1651. The brothers disguised the King in their clothes, and faithfully concealed him for several days, partly in the house and partly in the wood. On one occasion, from a thick oak in which he lay, he saw his unconscious pursuers passing his hiding-place. A tree, called the 'Royal Oak,' said to have sprung from an acorn of the old tree, still stands in the wood. The *B. Tracts* contain an interesting narrative of the above incident in Charles's life, written at the time, though first published in 1662. They are generally attributed to Thomas Blount, a Worcestershire gentleman, though this has been denied by his grandson, Nash, on Blount's own authority.

Bos'co Beale, a town in the province of Naples, South Italy, at the S. base of Mount Vesuvius, from one of the eruptions of which, in 1850, the town was in great danger of destruction, a large lava stream flowing down on both sides of it and desolating the neighbouring country. It has some trade in wine and silk, which are largely produced in the vicinity. Pop. 4553.—**B. Tre-Os'co**, an Italian town in the province of Naples, situated close by Bosco Reale, has a royal manufactory of gunpowder and arms. Pop. 9163.

Bos'covich, Roger Joseph, an eminent mathematician and physicist, was born at Ragusa, May 18, 1711, became a member of the Society of Jesus at an early age, and occupied in succession the chairs of Astronomy at Rome, Pavia, and Milan, at which place he died, 12th February 1787. He was a strenuous supporter of the Gravitation Theory, and boldly extended Newton's conceptions to the ultimate state of matter.

Bo'sio, François-Joseph, Baron, a French sculptor, was born at Monaco, 19th March 1769, and studied at Paris under Pajou. By order of Napoleon I. he executed the bas-reliefs for the column of the Place Vendôme, became a member of the Academy of Fine Arts in Paris, received from Charles X. the title of Baron, and died at Paris, July 29, 1845. B. executed numerous busts, among others, of Napoleon I., Josephine, Louis XVIII., Charles X., &c. Among his best-known works are his bronze 'Hercules,' in the garden of the Tuilleries; the 'Young Hyacinth,' in the Louvre; a marble group of 'History

and the Arts consecrating the Glories of France,' &c. B.'s works are models of grace, proportion, and elaborate finish.

Bosjes'mans (i.e., *Bushman*), a name given by the Dutch to a degraded branch of the Hottentot race, inhabiting the country N. of Cape Colony, and which is rapidly dying out.

Bos'na-Seraï, or Serajevo (i.e., 'palace of Bosnia'; Ital. *seraglio*), chief town of the former vilayet of Bosnia, on the river Bosna, 92 miles N. by E. of Ragusa, and 116 miles S.W. of Belgrade. It is surrounded by mountains, and though now stripped of its former defences, is still a place of strength. It is the seat of the governor-general of the province, and contains 100 mosques, a number of Greek, and several Catholic churches. Its chief manufactures are arms, copper, iron, lead, and gold wares, and woollen, leather, and cotton goods. Pop. 50,200, mainly Turks. B. was founded in 1263. A terrible fire in August 1879 rendered 20,000 people homeless, and inflicted a loss of 100,000,000 florins.

Bos'nia (*Bosna*), formerly a vilayet in the N.W. of European Turkey, consisting of B. Proper, Turkish Croatia, Turkish Dalmatia, and the Herzegovina, now placed under the military administration of Austria, is bounded N. by the Save and Unna, E. by the Juhlañik mountain range, S. by the Scardagh mountains, and W. by the mountains of Cosman, Timor, and Steriza. Area, 23,320 sq. miles; pop. (1873) 1,279,298. The S. part consists of vast tablelands, intersected by spurs of the Dinaric Alps, ranging from 6000 to 7000 feet in height, and presenting snow-covered peaks from September to June; while in the N. the country gradually declines to the plain of the Save and Unna, and is watered by the Bosna, Ocrina, Drina, and the Verbas. The climate of B. is delightful, the air being mild and clear. There is much cattle, corn, fruit, wood, and wine, and also, although almost unwrought, abundance of metallic treasure, including gold, silver, lead, coal, and quicksilver. Iron is the only metal mined extensively. At Novibazar, Banja, Budimir, &c., there are many mineral springs. The transit trade, which is mostly in the hands of Jews, Greeks, Armenians, Italians, and Germans, is much hindered by the want of good roads. The population, chiefly of Slavonic origin, is composed of Bosnians, Servians, Morlacks, Croats, Turks, Greeks, Jews, Gipsies, Wallachians, &c. In 1868 some 431,200 belonged to the Greek, and 171,764 to the Roman Catholic Church, while there were in all 418,315 Mohammedans. B. has extensive manufactures of weapons, especially sword-blades, woollens, cutlery, and morocco leather. A projected railway through B. was in abeyance in 1875. The capital is Bosna-Seraï (q. v.), and the next important towns are Banjaluka, Travnik, Mostar, and Fotesha.

In the Roman time, B. formed part of Pannonia; was divided into four Christian dioceses under Justinian; formed separate states or *dans* in allegiance to the Servian and Croat kingdoms from 940; in the 12th and 13th centuries belonged to Hungary; was taken (1339) by the Servian king Stephen, and on his death remained for a short time independent. In 1398 it became tributary to the Ottoman empire, and was made a Turkish province in 1503. The tyrannous policy of the Porte led to frequent outbursts of rebellion, as in 1737 and 1851, but the power of the conqueror was long sufficient to maintain possession of the province. In 1875, however, the imposition of several special taxes, levied exclusively on the Christian rayahs, a grievance aggravated by the rapacity of the collectors, led to an insurrection in Herzegovina. Originating in a local grievance, it soon assumed the proportions of a national movement, spread to Montenegro, and had the sympathy of Servia. The promulgation at Constantinople of an imperial firman, dated 14th December 1875, decreeing great reforms in the public administration, came too late to satisfy the insurgents, who were bent on achieving independence. Desultory fighting continued to take place. The Turkish troops were generally successful, and crowds of Bosnian peasants sought refuge within Austrian territory, but the insurgents could not be subdued. In March 1876 their demands increased. The Bulgarian massacres in May, and the Servian declaration of war in June, made it still more difficult for the Porte to crush the rebellion, and finally the terrible struggle with Russia made it impossible. The solution arrived at by the Treaty of Berlin (July 1878) was to place B. and Herzegovina under the military administration of Austria, whose troops in August 1878 entered

the province, but encountered fierce opposition from the more fanatical section of the inhabitants, partly abetted by the Turkish soldiery. The Austrian authority, however, was finally established before the close of 1878. See Maurer, *Reise durch B., die Saveldner, und Hungarn* (Berl. 1870); and *Turkey and Russia: Their Races, History, and Wars* (T. C. Jack, Edinb. 1878).

Bosporus ('Ox-ford'), the Greek name of the strait that unites the Black Sea with the Sea of Marmora. To distinguish it from other straits similarly named, it was known as the *Thracian B.* It is about 17 miles long, 600 yards wide where narrowest, and 1640 yards opposite the gate of the Seraglio, Constantinople. It has a great depth of water. There are two lighthouses at each end. The statement of Pliny that the opposite shores are within the range of the human voice is not correct. The Strait of Kaffa, or Yenikalé, which unites the Sea of Azof with the Black Sea, was named by the ancients the *Cimmerian B.*

Bosquet, Pierre François Joseph, a distinguished French general, was born at Mont de Marsan, in the department of Landes, France, 8th November 1810. He was educated for the army, and in 1834 distinguished himself in Algeria. He further played an important part in the Crimean war, especially at the battles of Alma, 25th September 1854, and Inkerman, 25th November, receiving for his services to Lord Raglan at the latter engagement a vote of thanks from the British Parliament. At the capture of the Malakoff, 8th September 1855, he was wounded by the bursting of a shell, and had to return to France. Next year he was made a field-marshal. B. died 4th February 1861.

Boss, in mediæval architecture, a piece of stone usually carved in a fanciful manner, which covers the intersections of the ribs of ceilings. It is commonly finished with a flower or a human mask.

Boss in St Giles's Cathedral, Edinburgh

Boss, in mediæval architecture, a piece of stone usually carved in a fanciful manner, which covers the intersections of the ribs of ceilings. It is commonly finished with a flower or a human mask.

Bossuet, Jacques Bénigne, a great French ecclesiastical orator, was born at Dijon, 27th September 1627. Taught by the Jesuits of Dijon, he entered the Church in 1652, and became successively Dean of the Cathedral of Metz, Bishop of Cordan (1669), and Bishop of Meaux (1681), which see he occupied at his death. The admiration felt by Anne of Austria and Louis XIV. for his preaching procured for him the post of preacher to the court (in which he was succeeded by Bourdaloue), and of preceptor to the Dauphin, for whose instruction he wrote (1679) his *Discours sur l'Histoire Universelle*, an attempt to trace a general providence working for the Catholic Church in the Biblical history, in the history of ancient ethnic religions, except those of India and China, and in Christian history to the time of Charlemagne. B. also became warden of the Sorbonne, and in 1697 a member of the Council of State. At Meaux he was a devoted

bishop. B. died at Paris, 16th April 1704. His *Oraisons Funèbres* upon contemporaries, such as De Condé, Gustavus, Cromwell, Mazarin, the Dukes of Orleans, are splendid specimens of lofty religious eloquence. B. was great in the theological controversy as well as in preaching. In his *Réfutation du Catechisme du Paul Ferri* he combated the doctrines of the Huguenots. In *Maximes sur la Comédie* he vehemently opposed Father Caffaro, who had defended theatrical entertainments. His *Exposition de la Doctrine de l'Eglise Catholique sur les Matières de Controverse* (1671), after being for some time discountenanced at Rome, was formally adopted by the Gallican clergy at the great synod of 1682, where B., who discussed with Leibnitz the scheme of Molanus for the union of the Lutheran and Gallican Churches, supported the Régale of France, the customs of the Gallican Church, and the superior authority of general councils, against the Papal claim to temporal sovereignty, all vacant benefices, and spiritual independence of the Church. This book is said to have converted Marshal Turenne to the Catholic Church. The *Histoire des Variations* (1688) is intended, by a survey of the German, Swiss, French, and English Reformations, to demonstrate the superior unity and authority of the Roman Church, and the inevitable tendency of apostasy into Socinianism. Basnage's *History of the Reformed Churches* was intended as a reply. B. also took part in the controversies with Port-Royal, and signed the formulary against Jansenius. His quarrel with Fénelon about Quietism is the one undignified passage in his life. In his *Politique tirée de Sainte Ecriture* he seems, at least rhetorically, to uphold the divine right of kings. The accounts of the semi-public discussion between B. and the Huguenot Claude are of the deepest interest. B. exerted himself to mitigate the 'dragonnade' which took place on the revocation of the Edict of Nantes. In 1875 Colonel Ferrel discovered in the Convent of Nancy a number of letters and unpublished MSS. of B., which had previously belonged to the Basompierre family. The Benedictine edition of B.'s works extends to 46 vols (Versailles, 1815-19), and is accompanied by a Life of B. by Cardinal Bausset. Another biography is that of Réaume (1869-70). There is an English (Catholic) Life by Charles Butler (vol. iii. of *Works*). B.'s secretary, Leducx, has left *Mémoires et Journal*. See also *B. and his Contemporaries* (Lond. 1875).—**Jacques B.**, nephew of the preceding, was born in 1644, and died Bishop of Troyes, 12th July 1743.

Boss, J. Charles, a celebrated French mathematician and physicist, and author of numerous excellent scientific writings, was born at Tartaras, near Lyon, 11th August 1730, and died at Paris, 14th January 1814. His most important works are *Traité Élémentaire de Mécanique et de Dynamique* (1763), *Cours Complète des Mathématiques* (7 vols. 1795-1801), *L'Histoire Générale des Mathématiques* (2 vols. 1810), and the *Traité du Calcul Différentiel et Intégral*.

Bostan'ji (Turk. 'garden watch'), the military guard of the Sultan's seraglio, named from their original office of superintendents of the imperial garden. At one time they numbered 5000 in peace and 12,000 in war time, but are now reduced to about 600. *B. Bashi* is the title of their commander, who is an official of rank and influence.

Boston, a borough and seaport on the Witham, Lincolnshire, 30 miles S.E. of Lincoln by railway. Its earliest name was St Botolph's Town, and the parish church of St Botolph, built in 1309, is a large and striking structure. The town, anciently an important commercial centre, has of late, owing to the reclamation of a large tract of fen-land in the neighbourhood, and the deepening of the river, acquired a considerable shipping trade, chiefly in the export of corn, cattle, and sheep. In 1873, 529 vessels with cargoes (tonnage, 21,739), and 63 in ballast (tonnage, 2281), entered the harbour of B.; while there cleared 172 with cargoes (tonnage, 8470), and 440 in ballast (tonnage, 24,813). It has, besides, manufactures of iron, sailcloth, rope, leather, and several breweries. Pop. (1871) of parliamentary borough, 17,518. B. returns two members to Parliament.

Boston, the capital of the state of Massachusetts, U.S., and the chief city of New England, 237 miles N.E. of New York by railway. The inlet on which it lies is deep, capacious, well protected, and studded with numerous islands. The railway system is very extensive, connecting B. with all parts of New England, New York, Canada, and the great West. The opening

of the Hoosac Tunnel recently in the western part of the state has greatly increased the facilities of B. in the western trade. The city stands upon a peninsula connected with the mainland by B. Neck, and is divided into B. Proper, South B., and East B., the last of which occupies an island nearly 2 miles long, and is about 600 yards from B. Proper. The river Charles, which here enters Massachusetts Bay, is crossed by several long bridges connecting B. with its suburbs. Recently the *Back Bay* has been filled up, splendid streets now standing where formerly were waste waters, and it is proposed to deal in like manner with the extensive shoal waters known as 'South B. Flats,' filling in the tract with material obtained by dredging the harbour to a depth of at least 23 feet. The harbour, which is marked by four lighthouses, is one of the best on the E. coast of America. B. is called the 'Trimontane' city, because of three eminences on the peninsula, the chief of which is Beacon Hill, on which stands the State House. There are many other important buildings, such as the R. C. church of the Redemptionists (1875-78), towering on a hill over all B., the City Hall, Custom-House, Athenaeum, Music-Hall, Faneuil Hall, and a Free Library of 275,000 vols. Near the centre of the city is the famous B. Common, a public park of 50 acres. The chief manufactures are machinery, chemicals, boots and shoes, iron and brass castings; there is also shipbuilding, sugar-refining, leather-dressing, &c.

B. has a large trade with India, China, and Russia, and the various states of the Union. It receives from the other states grain, tobacco, coal, cotton, and rice, and returns are made in the products of her manufactures. B. is also a great emporium for leather, wool, petroleum, spirits, fish, and ice. At 30th June 1874, B. (along with Charlestown) registered 985 vessels of 312,381 tons. For the year ending 30th June 1874, the shipping statistics gave 599 American vessels with 228,155 tons, and 2118 foreign vessels with 502,614 tons entering the port. The clearances were 588 American vessels of 211,729 tons, and 2064 foreign vessels of 447,373 tons. The imports in the same year were \$51,166,740, and exports \$27,976,591, the export of iron and steel being \$1,216,934. B. has a large number of old families of great wealth, and the capital and financial worth of 'the solid men of B.' are proverbial. Pop. (1871) 250,526.

B. was founded in 1630, and has throughout been the historical centre of the old colonies. It has long maintained a high place in education, intellectual life, and public spirit, and it may well be regarded as the seat of literary culture in the United States, if not as the 'hub of the universe.' The Indian name of B. was Shawmut, supposed to mean 'living springs of water.' It was called B. in honour of the Rev. John Cotton, first minister of the place, formerly vicar of St. Botolph's, in *Boston*, England.

A great fire took place in B. in November 1872, destroying 776 buildings and \$60,000,000 of personal property. Roxbury was annexed to B. in 1868, Dorchester in 1870, Charlestown, Brighton, and West Roxbury in 1874. Bunker's Hill (q. v.) is now included within the bounds of the city.

Boston, Thomas, a once notable Scotch divine, was born at Dunse, March 7, 1676. He entered the University of Edinburgh in 1691, was licensed as a preacher in 1697, and was ordained at Simprin, September 21, 1699, where he remained till 1707, when he was removed to Ettrick. While visiting in his parish, he found a copy of the *Marrow of Modern Divinity*, by Edward Fisher, an English Puritan of the 17th c., and brought it to the notice of some ministers, one of whom republished it in 1718. B. and others were prosecuted in the Assembly on account of upholding the doctrines of the *Marrow*, and the dispute ultimately ended in the secession of the Erskines. Although B. did not leave the national Church, he may be called the *sons et origo* of all her subsequent agitations. His death took place May 20, 1732. B. was a fair scholar, a man of vigorous and pungent mind, well versed in Scripture, and not without literary faculty. His most famous book, once very precious in the eyes of Scottish piety, is the *Fourfold State* (1720), but a finer, though simpler production, is the *Crook in the Lot*.

Boswell, James, the 'first of biographers,' was the son of Lord Auchinleck, one of the judges of the Court of Session, and was born October 29, 1740, at Edinburgh. Originally intended for the bar, he studied at the Universities of Glasgow and Utrecht, and in 1766 he was admitted a member of the Faculty of Advocates. In 1763 he made the acquaintance of

Samuel Johnson in London. He at once fell down and worshipped him. After a tour on the Continent, in the course of which he became an ardent advocate of Corsican independence and an admirer of General Paoli, whose memoirs he wrote, he returned to Scotland, became, in 1773, a member of the Literary Club founded by Johnson, whose acts and sayings he now began to record with a fidelity and fulness to which there is no parallel. After various amours, of which a full account appears in a posthumous volume of *Letters of James B. addressed to the Rev. W. F. Temple* (1856), he married in 1769 a Scotch lady named Montgomery. For many years previous to Johnson's death in 1784, he had been his constant companion, and in 1785 he published a journal of that *Tour to the Hebrides* in which he was Johnson's associate, and in 1791 his *Life of Johnson*. The latter is acknowledged to be the best and fullest biography ever written, and no character in literature has been so carefully portrayed as that of Johnson. B. died in London, June 19, 1795. He was a vain and self-indulgent, but amiable and open-hearted man, and in his writings he makes no attempt to conceal his weaknesses. See *Boswelliana*, the *Commonplace Book of James B.*, edited, with a memoir, by Dr Rogers (Lond. 1874). His eldest son, **Sir Alexander B., Bart.**, born in 1775, was a man of considerable ability and humour, which were shown in his *Songs*, chiefly in the *Scottish Dialect*, published in 1803. He was killed at Auchtertool, in Fifeshire, in a duel with Mr Stuart of Duneart, arising out of a keen parliamentary contest, March 26, 1822. B.'s younger son, **James B.** (born 1779, died 1822), annotated the *Life of Johnson*, and produced a scholarly edition of Malone's Shakespeare in 21 vols. 8vo, 1821.

Boswellia, a genus of plants of the natural order *Amyridaceae*, from which the gum resin known as *olibanum*, the *frankincense* of the Bible, is derived. It is now chiefly obtained from three species of B. (*B. Carterii*, *B. Bhau-Dajiana*, and *B. Frereana*), natives of Arabia and the Somali country in E. Africa. *B. papyrifera* of Abyssinia also yields a fragrant gum resin. See Cooke's *Report on the Gums, Resins, &c., of the India Museum* (1875).

Bosworth, or **Market Bosworth**, a town of Leicestershire, on a rising ground, 11 miles W. of Leicester, and overlooking the moor where was fought the celebrated battle which ended the struggle between the houses of York and Lancaster, and in which Richard III. was slain, August 21, 1485. The chief industry of B. is the knitting of worsted stockings. The town has a well-endowed free grammar-school, in which Dr Johnson was once usher. Pop. (1871) 13,746.

Bosworth, Joseph, D.D., well-known as a philologist and Teutonic scholar, was born in 1789. He was educated at Repton in Derbyshire, of which county he was a native, but graduated at Aberdeen. After holding several livings in England, he went to Holland as British chaplain, remaining there from 1831 to 1840. He was appointed rector of Water Stratford, near Buckingham, in 1858, and later became professor of Anglo-Saxon at Oxford. Dr B.'s studies in that language have given him celebrity. His *Elements of Anglo-Saxon Grammar* appeared in 1823, his *Dictionary of the Anglo-Saxon Language* in 1838, and his *Abstract of Scandinavian Literature* in 1848. Among his other works may be mentioned his edition of the Gospels in Gothic of 360 and in Anglo-Saxon of 995, with Wycliffe's and Tyndale's versions in parallel columns (Lond. 1865; 2d. ed. 1873). B. died at Oxford, 27th May 1876.

Böszörmény, the chief of the six towns of the free district of Hadjuk, in the E. of Hungary, 12 miles N.N.W. of Debreczin, with an active trade in rye, tobacco, water-melons, soda, and saltpetre. Pop. (1869) 19,208.

Botanic Garden, a garden devoted to the cultivation and arrangement of plants of scientific, economic, or other interest to the student of botany. The ancients knew nothing of such gardens, and even when the mediæval universities or wealthy men of science formed them, they were almost exclusively limited in their design to the cultivation of medicinal plants, as their popular name of 'Physic Gardens' testifies. The chief botanic gardens on the Continent are the *Jardin des Plantes* at Paris, founded 1634, and now an important school of natural history, and those of Montpellier, Florence, Berlin, Schönbrunn, Copenhagen, &c. Nearly every considerable city and university town possesses a garden

of greater or less importance. In Great Britain, those of Kew, Edinburgh, and Dublin (Glasnevin), are the most important, though the Apothecaries' Company, the Royal Botanical Society, and the Royal Horticultural Society support at their own expense gardens of considerable extent in London. Kew receives a large subsidy from the Government, and under the successive direction of the two Hookers—father and son—has become an important scientific establishment, from which plants and seeds are sent to similar gardens in the country, the colonies, as well as to foreign gardens. There is a fine herbarium and library attached to the garden, which cause it to be much frequented by botanists from all countries, and no work on descriptive botany published of late years but owes much of its value to the assistance afforded by the Kew garden and herbarium. The Edinburgh garden is not of so much scientific importance, but on small funds is excellently kept. It was founded in 1680, and is now chiefly used as an adjunct to the botanical class of the university. The Glasnevin B. G., near Dublin, is of less note. In America there are many such gardens, such as that of New York, Cambridge, &c., though none of them rank high in scientific reputation, being more pleasure grounds than true botanic gardens. In India, there are several, that of Calcutta being of great magnificence and extent.

Botan'omancy (Gr. *botane*, a plant, and *manteia*, divination), an ancient species of divination by the use of plants. It assumed various forms, as writing one's name on leaves, and then exposing them to the winds; rubbing poppy flowers between the hands, &c.

Botan'ometry. See PHYLLOTAXIS.

Bot'any, or Phytology (Gr. *phyton*, plant, *logos*, discourse), the science which treats of the vegetable kingdom in all its phases. These different aspects may be classified as follows:—1. *General Anatomy or Histology* (Gr. *histos*, a web), the consideration of the microscopic structure of the tissues which make up the different organs, viz., Cells, Vessels, and Fibres (q. v.). 2. *Organography or Phytotomy*, which treats of that portion of the science occupied in describing the form, relations, and structure of the different organs of the plant, such as the root, stem, leaves, and flowers. 3. *Morphology* (Gr. *morphos*, form), or *Philosophical B.*, the study of the transformation of organs. For instance, in this section, the various transformations of the leaf into sepals, petals, stamens, and pistil are traced. It is to B. what comparative anatomy is to zoology. 4. *Organogenesis* is the study of the development of organs. 5. *Physiological B.* is the study of the functions of the different organs and the processes of plant life. 6. *Vegetable Chemistry* may be looked upon as a branch of physiological B. 7. *Vegetable Nosology* is the study of the diseases of plants. 8. *Treatology* is the study of the various accidental monstrosities of plants, and is very useful in enabling us to ascertain the true morphological significance of certain organs. 9. *Taxology* (Gr. *taxis*, arrangement), *Taxonomy* (Gr. *taxis*, arrangement, and *nomos*, law), *Classification*, or *Systematic B.*, is that department of the science by which the various forms of plants are classified according to certain principles, so that a knowledge of them may be more easily acquired, or their structure, affinities, or properties be better understood and retained by the memory. The early botanists knew so few plants that any elaborate system of classification was unnecessary and scarcely ever thought of. For instance, Hippocrates, the father of medical science (400 or 500 B.C.), mentions only 234, and Theophrastes (310–225 B.C.) vaguely describes about 500. Dioscorides, whose works were long standards in B., describes 600; and Pliny (A.D. 79), who was nearly his contemporary, 800—a number not more than was known to Conrad Gesner in the middle of the 16th c. Linnaeus described in his *Species Plantarum* (1753) 6200 types, and at his death, notwithstanding the progress which B. had made in the interval, he was not acquainted with more than 8551 species, of which 7728 were flowering plants. At the present day, though the flora of Thibet, China, Corea, Africa, and other parts of the world is imperfectly explored, botanists have described 100,000 flowering plants (Phanerogamia) and 25,000 Cryptogamia. Some system of classification became, therefore, more and more imperative as the number of species of plants known increased. The system of Ray gave way to that of Tournefort, founded on the form of the flower, which long maintained its ground, especially in France. This in its turn was superseded by the sys-

tem of Linnaeus, a Swedish botanist (born 1707), who entirely revolutionised B. He introduced the binomial system of nomenclature, that is to say, every plant was distinguished by two Latin names—the first expressing the Genus (q. v.), the second the species. All flowering plants he divided into 23 classes; the 24th was the *Cryptogamia*, or flowerless. The first 11 classes of flowering plants are named from the number of Stamens (q. v.)—viz., *Monandria* (Gr. *monos*, one, *aner*, a man), those with one stamen; *Diandria* (Gr. *dis*, twice), with two; *Triandria* (Gr. *treis*, three), with three, and so on; *Tetrandria* (Gr. *tetras*, four), *Pentandria* (Gr. *pente*, five), *Hexandria* (Gr. *hex*, six), *Heptandria* (Gr. *hepta*, seven), *Octandria* (Gr. *octo*, eight), *Enneandria* (Gr. *ennea*, nine), *Decandria* (Gr. *deka*, ten), and *Dodecandria* (Gr. *dodeka*, twelve), those having from 12 to 20 stamens. Class XII. is *Isocandria* (Gr. *ikosi*, twenty), and Class XIII. *Polyandria* (Gr. *polys*, many), which have numerous stamens inserted on the receptacle. Classes XIV., *Didynamia*, and XV., *Tetradynamia* (Gr. *dynamis*, power), are characterised by the stamens being of different lengths—the former having two long and two short stamens, the latter four long and two short. The other classes are *Monadelphica* (Gr. *monos*, one, *adelphos*, brother), in which the stamens are united by the filaments into one bundle; *Diadelphica*, in which one stamen is free, the others united; *Polyadelphica*, in which they are united in more than two bundles; *Syngenesia* (Gr. *syn*, together, and *gune*, a woman, or *genesis*, generation), the stamens in which are united by their anthers; *Gynandria*, in which the stamens are united with the pistil; *Monacia* (Gr. *oikos*, a house), in which the stamens and pistils are on different flowers on the same plant; *Diacia*, in which the male and female flowers are on different plants; and *Polygamia*, in which the stamens and pistils may be on the same or different flowers, on the same or on different plants. These classes are divided into orders, the first 13 of which are founded on the number of divisions of the pistil—*Monogynia*, *Digynia*, *Trigynia*, &c., up to *Dodecagynia*, including all with 12 to 19 pistils, and *Polygynia*, all with 20 and upwards. The orders of Class XIV. are two in number, *Gymnospermia* (Gr. *gymnos*, naked, *sperma*, seed), in which the seeds, as in pines and firs, lie behind a scale without any fruit-wall covering, and *Angiospermia* (Gr. *ang*, a vessel), in which the seeds are enclosed by a closed fruit or capsule, as in all other orders of plants. In Class XIV. the orders are also founded on the fruit; those of Classes XVI., XVII., XVIII., XX., XXI., and XXII., on the number of the stamens; Class XIX. upon characters taken from the florets of compound flowers; Class XXIII. upon characters taken from the circumstance of the hermaphrodite male and female flowers being found in one, two, or three plants. The orders of Class XXIV.—viz., *Felices* (or ferns), *Musci* (or mosses), *Alga* or *Fungi*, are natural. The classification of Linnaeus was, with a few exceptions, an artificial one, but it was so simple and beautiful, that it was soon universally received. The founder himself knew that it was founded upon arbitrary principles, and was only a forerunner of something better. In turn it was superseded by the natural classification of plants which holds sway in the botanical world at the present day. This system was originally promulgated by Jussieu, a French botanist, and has been improved by the De Candolles, Robert Brown, Lindley, Endlicher, Meisner, the Hookers, Bentham, and others, though the broad principles are the same as originally sketched out by its founder. It professes to arrange plants, as far as possible, by their likeness to each other in all points of structure; those which are most nearly allied to each other being placed in groups by themselves, all parts of the plant being taken as the basis of comparison, and not, as in the Linnaean classification, simply the stamens and pistils. In this way the vegetable kingdom is divided into *Phanerogamia* or flowering plants, *Cryptogamia* or flowerless plants, or into three great divisions:—1. *Dicotyledons*, plants with two seed lobes, net-veined leaves, and stems with concentric rings of annual growth (*Exogenous*, q. v.). 2. *Monocotyledons*, plants with a single seed lobe, parallel-veined leaves, and *Endogenous* (q. v.) stems, in which the woody bundles (when present) are scattered through the cellular substance of the stem, and the growth of which is from within outwards. 3. *Acotyledons*, comprising all the Cryptogamia, and in which the stem, if present, is of the *Acrogenous* (q. v.) or summit-growing type, as in the tree ferns. Under these divisions are arranged various orders or families, the number of which varies according to the views held

by different botanists. For instance, there are the *Ranunculaceæ*, or Buttercup order, the *Rosaceæ*, or Rose order, the *Leguminosæ*, or Bean and Pea order, the *Liliaceæ*, or Lily order, &c.; while the orders of Acotyledons are nearly the same as in the Linnæan classification. The natural classification has now entirely superseded the Linnæan. It is more difficult to learn; but the student, having once mastered it, is in possession of something more than the name of a plant merely, as in the Linnæan system, which was only an artificial key. He has obtained by the study of one plant a knowledge of the general structure of the whole order, and, as similar organs will have similar functions, of the properties of the plants also. 10. A division of Taxology is *Glossology* (Gr. *glossa*, a tongue), or *Terminology*, a study of the profuse vocabulary of botanical terms which botanists use in describing plants; the art of describing plants is styled *Phytography* (Gr. *grapho*, I write). The study of the ancient vegetation of the earth, the remains of which is now entombed in the rocks constituting its crust, is (11.) *Palæo-phytology* (Gr. *palaios*, ancient), or *Palæontological B.*; while the study of the way plants are distributed over the earth constitutes (12.) *Phyto-geography*, or *Geographical B.* 13. The study of the uses of plants from an economical point of view constitutes *Economical B.*, of which *Medical*, *Agricultural*, *Horticultural*, and *Industrial B.* are divisions. The history of B. may be briefly summed up. Up to the seventeenth c., science had scarcely a place in the study. It was merely studied from a medical or astrological point of view, and the then state of knowledge is embodied in the numerous quaint herbals, containing an immense mass of absurdities, which date from that period. Then came the era of the classifiers, of which Linnæus was the chief. He was indeed the Luther of B. The mania for classifying and describing species was continued in an unbroken line by the promulgators of the natural system. Within the last twenty years, physiological and anatomical B. has been attracting to it more students than systematic B., and the progress of this branch of science has been great on the Continent, while, owing to the numerous collections which are always being sent home from our many colonial possessions, and by English travellers in foreign countries, systematic B. is more cultivated here. The brilliant discoveries of Charles Darwin have inaugurated a new era, which may be styled the *philosophical* one. The students of his great and increasing school do not content themselves with alone studying the structure and relations of plants, but endeavour to pry into the secrets of their origin, plan, and design in the economy of nature, and whatever may be said of the Darwinian doctrines, there can be but one opinion as to the wonderful impetus which his researches have given to B., as well as to other departments of science. See Balfour's *Manual of B.*, Brown's *Manual of B.*, and Sachs' *Text-Book of B.* (for the views of the German school).

Botany Bay is situated 14 miles S. of Port Jackson Heads, its northern limit (Cape Banks) being in 34° S. lat. and 151° 16' E. long. It measures five miles from N. to S., and six miles from E. to W., is open to the E., and affords no shelter for vessels. Cook's and George's rivers empty themselves into it. B. B. was the first point in Australia touched at by Cook, 28th April 1770, and owes its name to the large number of new plants discovered there by Sir Joseph Banks (q. v.). The first settlement in Australia was founded here 26th January 1788, but was soon after removed to the infinitely superior site now occupied by the city of Sydney (q. v.). From being the name of the first, B. B. came to be applied to any Australian convict settlement.

Bot-Fly, or Gad-Fly, the term applied to certain genera of flies included in the family *Cestrída* of the *Dipterous* order. The term 'bot' was originally applied to the larva or caterpillar state of the fly, whilst the name 'gad-fly' was given to flies belonging to the family *Tabanida*, of which the gad-fly (*Tabanus bovinus*) is a well-known member. The *Cestrída* possess a rudimentary proboscis; the antennæ are short, the terminal joint being provided with a bristle-like organ. Of this group, the horse-fly or horse-bot (*Gasterophilus* or *Cestrus equus*) is a typical example. This fly is found in Britain, though it is not so common in this country as on the continent of Europe. It averages half an inch in length. The body is woolly, and is coloured yellowish on the head, and reddish on the thorax and abdomen, with whitish wings. The female abdomen is prolonged to form a tubular organ. The

eggs being deposited in summer and autumn amid the hairs of a horse's coat, are licked off by the animal's tongue, and thus conveyed into the stomach. Within the horse's stomach the larvæ are developed, and provided with rings of bristly hooks, by which they retain their position on the walls of the organ. These larvæ remain within the body of their host all winter, and are discharged from the horse's alimentary canal during the following summer; and after passing their pupa state amid manure or in earth, emerge in a few weeks as the perfect winged insects. The pupa encloses itself simply within the dried larval skin. Another species is the *G.* or *C. hamorrhoidalis*, or red horse-bot, which resembles the previous form in habits. The ox-bot (*Cestrus bovis*) is the most famous member of this group, this species depositing its eggs by means of a pointed *Ovipositor* (q. v.) in the backs of oxen. The presence and development of the larva gives rise to a tumour known to agriculturists as a *wormil* or *worble*. This is filled with purulent matter, upon which the larva feeds; and at the proper time the larva emerges from its tumour, and undergoes its further development in the ground. An open sore is sometimes left in the ox's back after the exit of the larva. The adult fly is about half an inch in length, with brown wings and head, a black thorax or chest, and a whitish abdomen with a black band running round it. The sheep-bot (*Cestrus* or *Cephalemyia ovis*) deposits her eggs in summer in the nostrils of the sheep, the larvæ passing up to the *frontal sinuses* or spaces in the frontal bone, where they lie until the following spring, and pass down the nostrils to become pupæ, and to undergo their further development. These larvæ cause much irritation, and may even cause death by gaining access to the brain. The sheep-bot is of small size, the face being yellow and the body of a general grey colour. It inhabits damp situations. Other species of bots affect deer, reindeer, goats, and other herbivorous mammals.

Both, Andries and Jan, Flemish painters, pupils of Blomerts, were born at Utrecht, the former in 1609, the latter in 1610. The brothers studied, travelled, and worked together on the same canvas, Jan painting the landscape part of the subject, and Andries the figures. So perfectly were they in accord in mind and manner, that their works, which are rare and very highly valued, seem the productions of a single hand. Of these, a *View of Italy—Sunrise*, and a *Defile*, are in the Museum of Paris. Andries was drowned at Venice in 1650; his brother returned to Utrecht, and died in 1651.

Bothnia, the Latinised form of the name given in the middle ages to the coast lands around the Gulf of B., comprising the present Osterbotten of Finland and the Swedish län of Westerbotten.—**Gulf of B.**, the N. part of the Baltic Sea, lies beyond the Åland Isles, and between Sweden and Finland. It is 400 miles long, and on an average about 100 broad, with a depth varying from 20 to 50 fathoms. Although it contains many sandbanks, rocks, and islets, it is the least dangerous portion of the Baltic for navigation, has numerous excellent havens, and from both Sweden and Finland receives considerable rivers. In winter it is usually frozen over, and can be crossed on sledges. The chief towns on the E. shore are Åbo, Vasa or Nikolaistadt, Uleåborg, and Tornæ, on the extreme N.; and on the W., Umeå, Hernösand, and Gefle.

Bothriocephalus, a genus of *Platyelmia*, or flat worms, allied to the tape-worms. A single species of this genus (*B. latus*) inhabits the intestines of man, but is peculiar in its distribution, inasmuch as it is parasitic only in the inhabitants of Russia, Sweden, Holland, Poland, and Switzerland. The head of *Bothriocephali*—other species of which occur in fishes and water birds—is provided with two elongated depressions, by means of which it adheres to the intestinal walls. The separate zooids or segments of this 'worm's' body are very broad in proportion to their length, and the generative pore or aperture opens on the flat surface of each segment, not at the margin or side, as in the common tape-worm. This worm may attain a length of from 15 to 25 feet, and is more easily expelled than the common tape-worm. Its developmental history is still imperfectly understood; but it appears to exist in an immature or sexless form in fishes and other marine animals, and undergoes full development only when introduced into the bird or man, as the case may be. It is said not to pass through a *cystic stage*, as observed in the tape-worm, but this is a very doubtful statement.

Both'well, a village of Lanarkshire, parish of the same name, on the right bank of the Clyde, 8 miles S.E. of Glasgow, and near which the splendid Norman ruin of B. Castle overlooks the Clyde. The old B. Bridge was the scene of the famous battle of that name, in which the Scottish Covenanters were defeated by the royal troops under Monmouth, June 22, 1679. Pop. of village (1871), 1209.

Bothwell, James Hepburn, Fourth Earl of, was born about 1526, and on his father's death in 1556 became the chief noble in the S. of Scotland. Handsome and ambitious, he was thoroughly unprincipled, and in turn favoured and opposed the Reforming party. In 1562 he attempted to seize the Queen's person, was imprisoned, escaped, and outlawed on shunning his trial. A fatal passion which he inspired in the breast of Queen Mary was, however, the means of reinstating him at court, when he took the side opposed to Moray, who from the first had been his enemy. There can be little doubt that the murder of Darnley, on the 9th of February 1567, when the house at Kirk-of-Field was blown up, was his act, though whether the Queen was an accomplice or not is still matter of dispute. The subsequent sham trial and acquittal of B. on the charge of murdering Darnley, followed by his obtaining the title of Duke of Orkney, and his marriage to Mary, 15th May 1567, was the ruin of both. The nation rose in revolt; Mary's soldiers refused to fight; she was brought back a prisoner to Edinburgh; while B. fled first to Orkney and then to Denmark, where he was imprisoned, after making a confession, it is asserted, in the Castle of Malmoe, exonerating Mary, seemingly at the instance of a certain Anna Trandson, who claimed him as her husband, and procured the promise of a yearly allowance. He died about 1577 in the Castle of Draxholm. (See Burton's *History of Scotland*.) His titles and estates were forfeited to the crown. B. has been the subject of dramas by Aytoun and Swinburne.

Both'y, the name given to houses on a farm in which unmarried men are lodged throughout the year, and to outhouses in certain counties of Scotland where women are accommodated during the time of potato-hoeing. Mr Stephens, in his *Book of the Farm*, makes the sweeping assertion that the B. system is a bad one, and that in his opinion 'it ought to be entirely abolished.' Mr Robb, in his little book entitled '*The Cottage, the B., and the Kitchen*, while from personal experience declaring that occasionally bothies are not fit for habitation, asserts that many of them are healthy and comfortable. He adduces various instances in Fife, Forfar, and Perth, where he found bothies with a general feeding-room, and with separate apartments for the various individuals. But there can be little doubt, that where the utmost care is not taken to secure cleanliness and comfort, the B. system is exceptionally pernicious to the moral habits of the peasantry.

Botonee, or **Botony**, in heraldry, is a Cross-Crosslet (q. v.), each arm of which terminates in the form of buds or buttons—usually three.

Bo-Tree, the name given to the banyan or peepul (*Ficus religiosa*) in Ceylon, where the Buddhists hold it in great reve-

Bo-Tree.

rence. It is planted near the temples. One near the city of Anaraganpoora is believed, on good historical grounds, to be 2163 years of age. It is looked upon with peculiar veneration, but pilgrims are only allowed to take away the leaves when they fall, the tree being accounted too sacred to be touched with a knife. See Tennent's *Ceylon* (1860).

Botrych'ium, the moonwort, a genus of ferns, of the division *Ophthaloglossae*. There is only one British species, *B. lunaria*, which, though widely diffused, is not generally common. *B. virginica*, though not found in Britain, is widely scattered over Australia, Asia, Norway, and America, where it is known as the rattlesnake fern. Its roots are boiled and eaten in the Himalayas, New Zealand, &c. According to Scottish folklore, witches, when they strode broomsticks in their midnight expeditions, used the moonwort for a saddle.

Botryll'us, a genus of compound *Ascidians* (q. v.) or *Tunicate Molluscs* (q. v.), found incrusting the stones and other marine objects. *B. violaceus* is the common species; and, as exhibited in the accompanying cut, these organisms consist of a number of individual tunicates, each possessing a distinct mouth, and united to form a compound mass by the fusion of the *tests* or outer layers of their bodies. A common anal or excretory orifice exists in the centre of the mass.

Botryllus Schlosert.

Botry'tis, a genus of fungi of the division *Hyphomycetes*, containing various plants, which constitute Mould (q. v.), Mildew (q. v.), &c. The genus consists of a thread-like mycelium, which enters into and penetrates through the tissues of the plant or other object, on which it becomes parasitic, and sends up a cellular shoot, which bears the fructification at its extremities. A species of B. constitutes the silkworm rot, or Muscardine (q. v.), and another (*B. parasitica*) is very destructive to turnips. *B. infestans* is by many observers believed to be the cause of the Potato Disease (q. v.).

Bott'a, Carlo Giuseppe Guglielmo, an Italian historian, physician, and poet, was born at San Giorgio, Piedmont, 6th November 1766, studied at Turin, and in 1794 was appointed physician to the French army of Italy. He was elected a member of the Piedmontese *Consulta* in 1800, but incurred the displeasure of Napoleon by colling some of his measures despotic, and ceased to be a member of the legislative body in 1814. B. was subsequently for some time rector of the academy at Rouen, and died in Paris, 10th August 1837. His most important work is *Storia d'Italia, 1490 al 1814* (20 vols. Par. 1832), the portion from 1490 to 1534 being a republication of Guicciardini. Among his other productions may be mentioned *Histoire de l'Amérique* (Par. 1809), and *Il Camillo, o Vejo Conquistata* (Par. 1816), a poem in twelve cantos, full of noble versification and striking beauties. See *Vita di B.* by Dionisotti (1868), and B.'s *Letters*, published by Paolo Pavesio at Turin in 1875.—**Paul Emile B.**, son of the preceding, a celebrated traveller, was born in 1805. After a voyage round the world, he went in 1830 to Egypt as a physician, and accompanied the Egyptian expedition to Sennaar in this capacity, at the same time making a zoological collection. When French Consul at Alexandria, he undertook a journey into Arabia in 1837, the account of which is given in his *Relation d'un Voyage dans l'Yémen* (1841). He was then appointed consular agent at Mosul, where he began his explorations in 1843, and soon after discovered the ruins of Nineveh, described in his *Monument de Ninive*, with fine illustrations by M. E. Flandin (5 vols. Par. 1849-50). A cheaper edition of this work appeared as *Inscriptions découvertes à Khor-sabad* (1848). B. went as General Consul to Jerusalem in 1847, and to Tripolis in 1857. He returned to France in 1868, and died in April 1870, at Achères, near Poissy. B. greatly enriched the Louvre with his discoveries, and earned for himself an honourable name as the pioneer of Assyrian archæology.

Bott'a'ri, Giovanni Gaetano, an Italian scholar and *savant*, was born at Florence, January 15, 1689. He superintended a new edition of the Dictionary of the Della Crusca Academy; and having gone to Rome in 1730, became Professor of Church History and Polemical Theology in the College of La Sapienza, assisted Manfredi to determine the level of the Tiber, and subsequently became librarian of the Vatican and Canon of Santa Maria Transteverine. B. died at Rome, June 3, 1775. Of his numerous works may be mentioned his *Virgil*, from the Vatican MS. (1740); his dissertations on Dante, Boccaccio, and Livy,

his *Del Museo Capitolino* (2 vols. 1741 and 1750); and his treatises on the Catacombs of Rome and on the Vatican. See *Grazzini, Elogio di M. Giov.-Gast. B.* (Flor. 1818).

Böttger, or Böttcher, Johann Friedrich. See PORCELAIN MANUFACTURE.

Böttger, Karl August, a German antiquary of repute, was born, June 8, 1760, at Reichenbach, in Saxony. After studying at Leipsic, he became Director of the Gymnasium at Weimar (1791), where he associated with Goethe and Schiller. In 1804 he left this literary centre for Dresden, the art-capital, and there lectured on archæology and art. B. was chosen member of the French Institute in 1832, and died November 17, 1835. Among his chief works are *Sabina, oder Morgensenen einer reichen Römerin* (Leips. 1803); *Griech. Vasengemälde* (Weim. and Magd. 1797-1800); *Ideen zur Archæologie der Malerei* (Dresd. 1811); *Vorlesungen und Aussätze zur Alterthumskunde* (Altenb. 1817); *Kunstmythologie* (Dresd. 1811); *Amalthæa* (Leips. 1821-25); and *Ideen zur Kunstmythologie* (Dresd. and Leips. 1826). See *Karl Aug. B., eine biographische Skizze* (Leips. 1837), by his son, Karl Wih. B., who died in 1862, after obtaining a respectable name as a writer of histories and biographies.

Bottle (Fr. *bouteille*, from *botte*, a bunch), a vessel with a narrow neck for holding liquids, commonly made of glass (q. v.) or stoneware. In early times animal skins were fashioned into bottles, and even now vessels of leather are used by many Asiatic tribes.

Bottle-Chart is a marine chart showing the probable route which a sealed bottle, thrown into the sea at some point in mid-ocean, would take in reaching its destination. From numerous instances, Captain Beecher, an English naval officer, has constructed such a chart; and as the track which the bottle takes must depend chiefly on ocean currents, a method is thus suggested for the determination of such currents. See CURRENTS.

Bottle-Gourd, the fruit or 'gourd' of *Lagenaria vulgaris*, so called from being frequently used to hold liquids.

Bottlehead or Bottlenose Whale (*Globicephalus*, or *Phocaena globiceps*, or more recently *Hyperoodon bidensatus*) a genus of Cetacea belonging to the *Delphinidae* or Dolphin family, and sometimes known as the 'Caing Whale' of the Orkney and Shetland Islands. The B. is, however, not a true whale, but is more nearly allied to the dolphin. The forehead is high and round, the muzzle projecting to form a short beak; two small teeth exist in front of the lower jaw, and one dorsal fin is placed far back on the body. The single nostril or blowhole is crescentic in shape. The skin is smooth, the body being black or leaden on the back, and light or whitish on the belly. Bottle-whales may attain a length of 20 or 25 feet, and are gregarious in habits. They are frequently captured by being driven on shore, the entire flock following the example of a stranded leader. When captured they make a great noise by bellowing. They generally swim near shore, and sometimes enter rivers and harbours, presumably in pursuit of herrings and other fishes.

The *Delphinus tursio*, a species of true dolphin, with a round forehead and long slender beak, occasionally found around the British coasts, has sometimes also been named the 'Bottlenosed Whale.'

Bottle-Tit, a name given to the long-tailed titmouse (*Parus caudatus*), a familiar British species of *Dendroica* Insectivores, or Perching Birds, forming the sub-family *Parinae*.

Bottle-Tit.

The colour is grey on the head, throat, and cheeks, a band of black passing over the eye, extending over the shoulders and back; whilst the central tail-feathers are black. The wings are black, and the shoulders and lower back are reddish. The average length is 5½ inches. The eggs are usually very numerous, ranging from eight to sixteen in number.

Bottom, as a nautical term, means strictly that portion of a ship which is under water; but in a more general sense it signifies

the ship itself, as in the expression, a trade in British bottoms.

Bott'omry, Bond of, is a mortgage which the owner of a ship gives for outfit or repairs given to enable him to proceed on his voyage. The bond is so called because the keel or *bottom* of the ship is pledged figuratively, to denote the whole of it. In this contract it is understood that if the ship be lost, the lender loses the whole of his money; but that if it return in safety, he shall be paid the principal sum, with whatever interest upon it may have been stipulated for. The amount of loan on B. B. is not in England restricted by law, though it is so in many maritime states. The bond commonly states the risks to which the lender is liable. Usually they are the same as those for which the underwriter is liable under a policy of insurance. See CAPTURE; RESPONDENTIA, BOND OF.

Botzen, Bozen, or Bolzen (Ital. *Bolzano*), a town beautifully situated in the circle of Brixen, Austrian Tyrol, on a small branch of the Talfer, 70 miles N. of Verona, 115 S. of Munich, and 255 S.W. of Vienna, with which places it is connected by rail. It is a flourishing entrepôt, and has manufactures of silks, linens, leather, and hosiery. It has a cathedral of the 14th c., several fine Italian buildings and arcaded streets, and lies in a district rich in wine and fruits. Pop. (1869) 9355.

Bouchain, a fortified town in the department of Nord, France, and a station on the railway between Cambrai and Lille, lies on the Scheldt, 120 miles N.N.E. of Paris, with some industry in beet-sugar making and salt refining. It was captured by the Duke of Marlborough in 1711, and recovered by the French in the following year. B. has the means of flooding the adjacent country as a mode of defence. Pop. (1872) 1039.

Bou'cher, Francois, a French painter and engraver, born at Paris, 29th September 1703, studied under Le Moine, from whom he received the traditions of Rubens, and in 1723 gained the first prize for painting. Two years later he went to study at Rome, became a French Academician in 1734, and court painter in 1765, and died at Paris, May 30, 1770. B. was marvellously expert in work, but it was not of a high or pure kind, any more than his own life. French critics say that it seduced and perverted many a young artist; and one notices with pleasure that his reputation fell at the Revolution. Among his more notable productions are *Venus ordering Arms for Æneas* (1732), *The Bath of Diana* (1742), and *Portrait of Mde. de Pompadour* (1757). His engravings are very numerous.

Bouches-du-Rhone, a maritime department in the S.E. of France, situated at the mouths of the Rhone, hence its name. Area, 1971 sq. miles; pop. (1872) 554,911. It was formerly part of Provence, and consists in the S.W. and along the banks of the Rhone of partly cultivated plains (*La Camargue* and *La Crau*), but in the E. portion it is invaded by the lower offsets of the Maritime Alps. It is bounded on the N. by the Durance, and on the W. by the Rhone, which before entering the Mediterranean divides into two great arms, enclosing the delta, *Ile de la Camargue*. The climate is excessively hot for France, and mainly owing to this only about one-fourth of B. is cultivated, producing corn, rice, figs, the olive and mulberry. There is much cattle-rearing. The soil in many parts is impregnated with salt, and there are many salt lakes connected with the sea, the chief of which is the Etang de Berre (q. v.). Marseille is the capital; Aix and Arles are the only other towns of large size. There are many small ports with considerable trade. B. holds the first rank for international trade among the departments of France. It has several extensive canals, and is traversed by the railway *Paris à Lyon et à Marseille*, with branches to Nîmes, Aix, and Nice.

Bou'icault, Dion, actor, dramatist, and theatrical manager, was born at Dublin, December 26, 1822, and was educated at London University, but early showed a strong liking for the stage. In 1841 his comedy of *London Assurance* was produced at Covent Garden, and acquired a more legitimate success than perhaps any of his later and more popular dramas. It is throughout crude and lacking in originality, but is enlivened by sprightly cross-play of character, and much specious but effective dialogue. B. has since shown himself singularly prolific and versatile in the production of plays, of which some of the chief are his *Colleen Bawn* (1860), a clever adaptation of G. Griffin's Irish novel, *The*

Collegians; The Octoroon (1861); *Flying Scud*, a dramatic exposure of turf chicanery (1866); *After Dark* (1868); *A Dark Night's Work* (1870); and *Formosa* (1871). In his later works B. has let all the legitimate arts of the dramatist give place to vulgar 'sensational' incidents, culminating in a plot of violent improbability. He is also known as the founder of the 'upholstery school' of art, the main features of which are complete command of stage mechanism, and an uncompromising realism in matters of dress, furniture, &c. B. is favourably known as an actor of Irish parts. His wife (*née* Miss Robertson) has also earned the reputation of a popular actress.

Bou'doir (from the Fr. *bouder*, to pout or be sulky), a room to which a lady may retire when she wishes to be alone, or to receive only her more intimate friends. The fashion of having boudoirs was introduced by the mistresses of Louis XIV., but the word itself has existed from the 13th c.

Bou'farik, a town and military station of Algeria, 16 miles S.S.W. of Algiers by rail, with trade in esparto grass, tobacco, cattle, and fruit. Pop. (1872) 2588.

Bouffiers, Louis-François, Duc de, peer and marshal of France, son of François II., Count of B. and Cagni, born 10th January 1644, entered the army in 1662, served with great distinction under Condé, Turenne, Crequy, Luxembourg, and Catinet in Germany and the Netherlands, and died at Fontainebleau, March 22, 1711. Few soldiers of his time saw more service, and the record of his exploits is only to be found in the military history of the latter half of the 17th c. For his gallant and determined defence of Lille against the allied armies he was appointed 'perpetual governor' of that city, and after the defeat at Malplaquet, so masterly was his command of the retreat, that neither men nor cannon were allowed to fall into the enemies' hands.

Bouffiers, Stanislas, Marquis de, son of a French nobleman in the service of Stanislas, King of Poland, was born at Lunéville in 1737. His first considerable appointment was that of governor of Senegal and Goree, where his wise and beneficent administration is not yet forgotten. On his return to France he became a prolific writer of light literature; in 1789 he was chosen a member of the States-General; but after August 10, 1792, left France, and received from Friedrich Wilhelm an extensive estate in Prussian Poland. In 1800 he returned to France, resuming his former literary pursuits; in 1804 was admitted a member of the Institute, and died 18th January 1815. A collected edition of his works was published at Paris in 1813, in 2 vols.

Bougainville, a bay, island, and strait, named after B., the French navigator. The bay is in Patagonia, on the N. side of the Strait of Magellan; the island belongs to the Solomon group, E. of New Guinea, Polynesia, and is hilly and populous; and the strait is in the New Hebrides, separating Mallicollo on the S. and Espiritu Santo on the N.

Bougainville, Louis Antoine de, a famous French navigator, was born at Paris, November 11, 1729. On the outbreak of the Seven Years' War in 1756, he accompanied the Marquis of Montcalm to Canada as aide-de-camp; and in June 1758 successfully withstood, with a force of only 5000 French, an English army of 24,000. In 1766-69 he undertook a voyage round the world, of which he gives an account in his *Description d'un Voyage autour du Monde* (2 vols. 1771-72; new ed. 1861). B. distinguished himself in the N. American war on the side of the colonists, and was made a field-marshal in 1780. At the outbreak of the Revolution he retired into private life, and died August 31, 1811.

Bought and Sold Notes are notes signed by a broker of goods sold through him. They are held to complete the transaction. They are not used in Scotland.

Bou'gies are instruments used by surgeons for dilating any of the mucous membranes of the body. They are generally made of metal, gum-elastic, catgut, or vulcanite. Metal B. may be solid or hollow. The metal may be block-tin, German silver, silver, or steel. When used for dilating the urethra in Stricture (q. v.), B. are shaped so as to enable the surgeon readily to introduce them into the bladder.

Bou'guer, Pierre, an eminent French mathematician and natural philosopher, was born at Le Croisic, in Bretagne, 16th February 1698, and in 1713 succeeded his father as Professor of Hydrography in his native town. In 1730 he obtained a similar office at Havre. From 1735 to 1742, together with Godin and De la Condamine, he measured a degree of the meridian in Peru. We are also indebted to him for valuable researches on the intensity of light, and for the invention of the heliometer. B. died August 15, 1758. His principal works are *Théorie de la Figure de la Terre* (1749), *Traité d'Optique sur la Gradation de la Lumière* (1760), and *Traité de la Navigation* (1769), the last two published posthumously by Lacaille.

Bouill'e, François Claude Amour, Marquis de, a French general, born 19th November 1739, at the Château du Cluzel, in Auvergne, where his ancestors had been established since the 11th c. He served with distinction in the Seven Years' War, was for twenty-eight years governor of Guadaloupe, during which time the American war broke out, when he was appointed commander-in-chief of the French West Indian forces, and captured in succession seven islands from England. In 1784 he visited England, and in recognition of his gallantry and humanity was presented with a sword by the city of London, and received a high encomium from the Queen in person. He advised the escape of Louis XVI., but by an unavoidable delay of two hours on the part of the troops commanded by B., Louis was captured at Varennes, June 20, 1791. This and a subsequent attempt to induce the Empress Catherine II. to supply 36,000 men for the invasion of France, made it prudent for B. to retire to England, where he died, 14th November 1800. His *Mémoires sur la Révolution Française* (Par. 1801), republished by MM. Berville and Barrière, is a work of much value. A new edition appeared in 1859.

Bouill'on (Ger. *Beulen*), originally a German duchy, but now the western portion of the Belgian Grand-duchy of Luxemburg, lies near the French frontier, and embraces a woody and hilly stretch of the Ardennes, containing a town of the same name and twenty-one villages. It once belonged to Godfrey of B., the famous crusader, who in 1095 pawned it to the Bishop of Liege to raise money for the expedition. After many vicissitudes it was finally incorporated with Belgium in 1837. Area, 157 sq. miles; pop. 21,000.—The town of B., the old family residence of the Dukes of B., is situated on the Semoy, among steep hills, 10 miles N.E. of Sedan, has a pop. of 4000, a strong castle, and some cloth and woollen manufactures.

Bouillon, Godfrey de, Duke of Lower Lorraine, 'a worthy representative of Charlemagne, from whom he was descended in the female line,' was born about 1061. His father was of the great family of the Counts of Boulogne, and Brabant, the lower province of Lorraine, was the inheritance of his mother. B. gained distinction in the armies of the Emperor Heinrich IV., and was the great leader of the first Crusade. According to the chroniclers, he performed prodigies of strength and valour against the infidels, and was unanimously proclaimed King of Jerusalem on its capture in 1099. 'But in a city where his Saviour had been crowned with thorns, the devout pilgrim rejected the name and ensigns of royalty' (Gibbon). He took the title of Defender and Baron of the Holy Sepulchre. At Ascalon, with 20,000 men, he defeated the Sultan of Egypt with 400,000. He then devoted himself to organise his government, and drew up, for his courts of justice, the Assizes of Jerusalem, a code of laws which was the fullest embodiment of feudal jurisprudence. He died in 1100, and was buried on Mount Calvary. His many virtues are justly extolled in Tasso's *Jerusalem Delivered*. See Gibbon's *Decline and Fall of the Roman Empire*, ch. 58.

Bouill'y, Jean Nicolas, a French dramatist, born at Coudray (Indre-et-Loire) in 1763. His first piece, *Pierre le Grand*, represented 13th September 1790, containing a couplet at the close complimentary to the Queen, procured for the author a present from her Majesty, which, some years after, as a confession of his error in having accepted it, he gave to the Society of Jacobins at Tours. He was called to the bar, and filled several important administrative and judicial situations in Tours, which he ultimately resigned to prosecute the drama. He also composed tales for the young. B. died at Paris, 14th April 1842. Of his numerous theatrical pieces may be specified *Jean Jacques*

Rousseau à ses derniers Moments (1791); *Les Irlandais-Unis* and *La Mort de Turenne* (1793); *La Famille Américaine* (1796); *Rend Descartes* (1796); *Lénore* (1798); *L'Abbé et l'Épée* (1800); *Madame de Sévigné* (1805); and *Haine aux Femmes* (1808). See *Quérard's Supplément à la France Littéraire*.

Boulainvilliers, Henri de, Comte, son of François, Comte de B., was born at St Saire, 11th October 1658. Educated at Jully, he entered the army, but pecuniary losses induced him to devote himself to study, when he chose for his subject the origin and growth of the great feudal families of France, which, unlike his monarchist predecessors, Daniel, Mézeray, &c., he regarded as the most important and durable element in the constitution. He also studied judicial astrology, and wrote a *Life of Mahomet* and a *History of the Arabs*. B. died 23d January 1722. His religious position is a disputed question. It is unlikely that a conservative antiquarian should be an infidel. (See vol. xvi. of Voltaire's Collected Works, *The Count of B.'s Dinner*.) B.'s chief works are *Histoire de l'Ancien Gouvernement de la France* (Hague, 1727); *État de la France* (Lond. 1727); and *Histoire de la Pairie de France et du Parlement de Paris* (Lond. 1753). B. must be judged by reference to his time, of which it has been said that Louis XIV. made 'of a great fief a great kingdom, and destroyed the feudal government of eight centuries, which Richelieu had already undermined.'

Boul'ay de la Meurthe, Antoine Jacques Claude Joseph, Comte, a French statesman, born at Chaumoncy, in the Vosges, February 12, 1761, is chiefly remarkable on account of his staunch adherence to the Empire. He was a member of the Council of Five Hundred (1797), where he opposed Jacobinism and declared moderate Revolution principles. In 1799 he issued an *Essai sur les Causes qui en 1649 amenèrent en Angleterre l'Établissement de la République, sur celles qui l'y firent périr*, a work which at once went through four large editions, and was widely read in the light of passing events. After the *coup d'état* of the 18th Brumaire, which he supported, he was three times made president of the legislative section of the Council of State, was the principal editor of the *Code Civil*, and for some time Minister of State. He was proscribed by the ordinance of July 24, 1815, following the second restoration, and resided in Germany till 1819, when he was allowed to return to France. From this period he lived in retirement, and died at Paris, February 2, 1840. B. published, when exiled from France, the *Tableau Politique des Règnes de Charles II. et de Jacques II., Derniers Rois de la Maison de Stuart* (2 vols. Buss. 1818), and after his return, *Bourienne et Erreurs Volontaires et Involontaires* (2 vols. Par. 1830).—**Henri-George, Comte B.**, son of the preceding, born at Paris in 1797, was a well-known philanthropist and social reformer. In 1848 he was elected a member of the National Assembly, where his popularity among moderate republicans led to his being made vice-president of the Republic in 1849. Subsequently he was a senator under the Empire (1852), and held various offices. He died at Paris, November 24, 1858.

Boulder, the name applied in geology to large blocks or masses of rock which are generally deposited in localities far removed from their original place of formation or situation. They may thus form prominent objects in a flat plain, and be utterly irreconcilable in mineral structure with surrounding and adjacent rocks. Boulders present valuable sources of the evidence of ice or glacial action, inasmuch as they may generally be found to have been transported to their present position through ice agencies; and they may bear on their surface ice-scratches and other typical markings. Boulders occur frequently throughout the various regions of the world.

Boulder Clay, Drift, or Till, a deposit belonging to the most recent *Pleistocene* or *Post-Tertiary* period of geology, and characterised by its consisting of unstratified clays, in which numerous masses of stone and boulders, varying greatly in size, are embedded. The B. C. is very generally recognised as the oldest of the *Pleistocene* deposits, but it is not always easy or possible to arrange these superficial formations in a definite or exact order. The colour and composition of the B. C. varies according to the source from which its materials have been derived. In a region where carboniferous shales prevail, the clay is of leaden grey or black colour, whilst in the neighbourhood of the Old Red Sandstone formation it may be red.

The impacted boulders vary in size from mere sandy grains to large rock masses several feet in length and several tons in weight. They exhibit *striae* or grooves and ice-markings; and from the direction of these markings it is often possible to indicate the line of motion of the ice mass which produced them. The rocks on which the B. C. rests, are generally rubbed and polished in a striated manner, and resemble thus the *roches moutonnées* of modern glacier districts. In some districts of Scotland, beds of sand, clay, and gravel, containing peaty vegetation and mammoth remains, appear intercalated with the boulder clays. The presence of such beds seems to indicate that warmer periods occurred periodically during the glacier period, when the ice thawed, and allowed a partial return of flora and fauna. The fossils of the B. C. are not characteristic or numerous. Shells derived from older formations and washed into the clay are found, whilst the remains of the mammoth, woolly rhinoceros, and other extinct mammals, are interspersed through this and allied formations. Certain glacial shells, generally of Arctic nature, occur in the clay, having been borne from the Arctic regions with the ice-drift of old. The B. C. is thus intimately and characteristically associated with the glacial or ice period, and of itself contributes no small share of evidence towards the due establishment and recognition of the latter epoch of recent geology.

Boulevards, or Boulevarts (Fr. from German *bollwerk*, Eng. *bulwark*), originally meant the ramparts of a fort or fortified town, but now used to designate the public walks which, in Paris and other towns, occupy the line of the former city walls, and which are usually wide promenades and carriage-ways lined with trees. The original and most famous B. are those of Paris, of which that running between the Bastille and the Madeleine is 2½ miles long. The Thames Embankment (see LONDON), though not occupying the site of former defences, is essentially a boulevard, and is one of the finest examples of that variety of promenade in the world.

Boulogne, a market-town in the department of the Seine, beautifully situated S.W. of Paris, about a mile beyond the fortifications, on the right bank of the Seine, and connected with St Cloud by a fine bridge. It has a quaint church of the 14th c., and near it is the castle of Rothschild. Pop. (1872) 18,687. The *Bois-de-B.* is a beautiful wooded park for recreation, extending from B. as far N. as Neuilly, between the fortifications and the Seine. It has three ornamental sheets of water, and is intersected by numerous alleys and drives.

Boulogne-sur-Mer, a seaport and bathing-place, department of Pas-de-Calais, France, at the mouth of the Liane, 19 miles S.W. of Calais, and 139 N.N.W. of Paris, with which places it is connected by rail. It is divided into Upper and Lower B., the latter of which, the maritime part of the town, is the most modern and fashionable. The chief buildings are the Hôtel de Ville, built in 1774; the modern Church of Notre Dame, in the Greek style; and the citadel, of the 13th c. The ramparts have been in part converted into fine promenades. There are also here the ruins of an antique lighthouse, said to have been built by Caligula; the marble column of Napoleon, 165 feet high; an extensive museum; one of the best bathing establishments in France; an hospital, barracks, large theatre, &c. The harbour admits vessels of 800 tons, has two long piers, and is protected by several forts. B. has a considerable coast trade, and communicates by steamer with London daily (9 hours), and with Folkestone twice a day (2 hours). The principal manufactures are cement, steel pens, linens, sailcloth, and beer. There are also extensive oyster and herring fisheries, while the fine sands attract annually a large number of visitors. Pop. (1872) 38,514, of whom many are English. B., originally a port of the Morini, was first called *Gesoriacum*, but received from the Romans the name *Bononia*, changed under the Karolings into *Belonia*. It was destroyed by the Norsemen (9th c.), rose again from its ruins, and was taken by Henry VIII. of England in 1544, and again restored by Edward VI. to France in 1550. B. was the point where, for the purpose of invading England, Napoleon concentrated his forces in 1804, and also where Louis Napoleon landed on his second attempt to overthrow the rule of Louis Philippe, August 6, 1840.

Boul'ton, Matthew, an English engineer and mechanic of merit, born at Birmingham, September 3, 1728. He is the

author of several important inventions, notably a new process of inlaying steel, and improvements in the machinery for coining, but is best known as the partner of James Watt, with whom he established a steam-engine factory (the firm being B. & Watt) in 1769, which long supplied all Europe. B. died at Soho, near Birmingham, 17th August 1809.

Bound, or Boundary. The boundaries of boroughs, cities, and towns in England and Scotland are regulated by various statutes of the reign of William IV. The boundaries of parishes are chiefly preserved by the ancient usage of *Beating the Bounds*. See PARISH. Various Acts of Parliament have been passed permitting and regulating the subdivision of parishes for ecclesiastical purposes, or *quoad sacra*, as it is called in Scotland.

Boundary Survey of Ireland.—This is provided for by various Acts of Parliament. These confer powers on the boundary surveyor to rectify errors in the names of lands in the Ordnance county maps, also to define the boundaries of parishes. Reports and plans are open free to public inspection at the Council Office in Dublin.

Bound Bailiff, the name of a sheriff's officer, corrupted by the people into *bun-bailiff*. See BAILIFF.

Boundary Charter or Infestment is, in the law of Scotland, a charter which describes the boundaries or 'marches' of land conveyed by it. It confers right to all within the bounds, and excludes it to all beyond. When a common wall is intended to be conveyed, this must be stated.

Boun'ty. The money given to men to induce them to enter the army or the navy is so called. The only B. at present given is what is called a *free kit*; that is, an equipment free of expense to the soldier in various necessities—shirts, boots, brushes, &c. In former times, when a high pecuniary B. was given, the soldier was made to pay highly for his kit, the B. thus becoming to a considerable extent nominal. In the Napoleonic wars, as much as £18 to £20 per head used to be given as B. It has always been higher in cavalry and in artillery regiments than in the infantry. In the royal navy, the term B. denotes the distribution of money sometimes made to officers and men on special occasions during active service.

Bounty, in political economy, is a grant by the state for the encouragement of a branch of national trade or industry. Thus in former times there were bounties on the exportation of corn, in the belief that they would encourage agriculture at home, and there were bounties on the importation of certain articles of colonial produce with the view of encouraging colonial industry. A B. then simply meant a tax upon the community for the benefit of a section of it; that is, a tax upon general industry in order to encourage a particular industry. The result of this is that men are induced to forego suitable occupations for others which are naturally unsuitable for them. The man who would have been a clever mechanic becomes a bad farmer, and so on. A B. is simply a measure of *protection*; and, as such, a misdirection of capital, industry, and talent. It is to be regretted that the B. system still greatly prevails in Europe.

Bounty, Mutiny of the, one of the most remarkable mutinies on record, took place 28th April 1789, on board H.M.S. *Bounty*, 215 tons, under Captain Bligh (q. v.), bound from Otaheite to the W. Indies, with some 1015 bread-fruit trees. It arose seemingly out of discontent on the part of the crew with the strict discipline of the ship after a long and delightful stay at Otaheite. When fourteen days out from the island, according to a concerted scheme, twenty-five of the men, headed by Fletcher Christian, mutinied, cast Bligh and eighteen others adrift in the ship's launch, and returned to Otaheite. Here sixteen of the men took up permanent residence, while the others, fearing pursuit, sailed to Pitcairn Island (q. v.), where, after a period of mad debauch, they founded a flourishing colony. Meantime, Bligh and his comrades, after a dreadful voyage of 3600 nautical miles, reached the island of Timor, to the E. of Java. On his return to England, Bligh published a *Narrative*, which roused a storm of excited feeling. The frigate *Pandora* was sent in search of the recreants, and succeeded in capturing ten of the number, who were brought to England and tried by court-martial, seven being acquitted and three being hanged, October 1792. See Sir J. Barrow, *The M. of the B.* (Lond. 1835); Lady Belcher, *The Mutiniers of the B., and their Descendants in Pitcairn and Norfolk Islands* (Lond. 1870).

Bounty, Queen Anne's, is the name given to a fund appropriated to increase the incomes of the poorer clergy of the Church of England. When Henry VIII. abolished the authority of the Pope in England, he annexed the 'first fruits' and 'tenths' to the crown. The *first fruits* are the profits of the first year of spiritual preferments, and the *tenths* are one-tenth of their annual profits, both chargeable according to the ancient declared value of the benefice—poorer livings being exempt from the tax. Under the Act 2 and 3 Anne, c. 11, it is formed into a fund for the augmentation of poorer livings and for the rebuilding of parsonages. Queen Anne's Act has been amended by various statutes. The fund is now administered by a corporation, entitled 'The Governors of the B. of Queen Anne for the Augmentation of the Maintenance of Poor Clergy.' The sum allowed to each augmentation is £20. Livings below £10 a year have the first claim, those below £20 a year the next, and so on in order while any remain under £50. Any living not above £45 a year may be specially augmented by £200 by the B., if privately augmented by the same sum. The money is to be expended on land to be annexed to the benefice.

Bounty Islands, a group of uninhabited rocky islets 480 miles E. of the S. Cape of New Zealand, situated in 47° 40' S. lat. and 179° E. long. They lie in the track of vessels bound from Bluff Harbour, New Zealand, round Cape Horn.

Bou'quet of Wine, the aroma or flavour of wine, which is the chief element in determining the value of any variety.

Bourbon, the name of one of the most ancient feudal families of France, connected with the beautiful province of Bourbonnais, lying to the N. of Auvergne, and watered by the Cher, the Allier, and the Loire. The family first emerges into public history by the marriage, between 1270-85, of Robert, sixth son of St Louis, Comte de Clermont, &c., to Beatrice of Burgundy, who, through her mother, Agnes, daughter of Archambault, was heiress of B. Thus two lines of royal blood from Robert the Pious were united. Robert's son Louis acquired La Marche, and was made a duke. The next duke, Pierre, fought at Crecy and Poitiers; his brother Jacques (of La Marche and Castres), 'the Flower of Chivalry,' accompanied King Jean II. as a prisoner to England. Louis III., Duc de B., became very powerful in the reign of Charles V. (the Wise), who married the duke's sister, Jeanne, and sent Du Guesclin and Jean de B. (the founder of the line of La Marche and Vendôme) to Castile, chiefly that the cruelties of Pedro towards his wife, Catherine de B., might be punished. The son of this Comte de la Marche fought against Bajazet in Hungary, became Great Chamberlain of France, married Joanna II. of Naples (1415), and finally became a Franciscan monk. Jean I., to whom Auvergne belonged, was in the meantime taken prisoner at Agincourt. His grandson, Duc Pierre (Beaujeu), married Anne, eldest daughter of Louis XI., and acted with her in the regency during the minority of Charles VIII. and his absence in Italy. Their daughter Susanne married her cousin, Charles de Montpensier, the great Constable of B. (born at Moulins, 1489), Louis XII. renouncing the royal rights reserved to the duchy. The Constable, after his brilliant victory of Marignano and defence of Milan, deserted the French cause for that of Charles V., defeated François I. at Pavia (1525), and finally perished at the storming of Rome (1527). For a time the estates were confiscated to the crown, but part was recovered by the B.-Vendôme family, which now became the eldest branch, represented by Charles, Duc de Vendôme, the Duc de Montpensier, and the Prince de la Roche-sur-Yon. Antoine, the son of Charles, and brother of Cardinal B. and the Prince of Condé, married Jeanne d'Albret, inherited the kingdom of Navarre, and bequeathed his feud with the Guises to his son, Henri IV., who succeeded the Angoulême branch of the house of Valois on the throne of France, the Salic law excluding the daughters of Henri II. The posterity of Louis Hutin was thus brought back to the throne. Of the children of Henri IV. we need mention only his successor, Louis XIII. (1610-43), who married Anne of Austria, daughter of Philip III. of Spain; Elizabeth, married to Philip IV. of Spain; and Henriette, married to Charles I. of England. Louis XIII. had two sons—Louis XIV., who married Maria Theresa, daughter of Philip IV. of Spain, and reigned till 1715; and Philippe, Duke of Orleans, the head of the Orleans branch, of which Louis Philippe (Égalité), beheaded in 1793, and his son, King Louis Philippe

(1830-48), were members, and which is now represented by Louis Philippe Albert, Comte de Paris, eldest son of the eldest son of King Louis Philippe. Louis XIV. was predeceased by his son, Louis Dauphin, and his grandson, Louis, Duke of Burgundy. The second son of the former was Philippe, Duc d'Anjou, the first of the Spanish Bourbons, who succeeded after the Spanish Succession War under the will of Charles II. The only surviving son of the Duke of Burgundy was Louis XV. (1715-74), who married Marie, daughter of the Polish King Stanislas. His son Louis Dauphin predeceased him, leaving a large family, of whom Louis XVI. (the husband of Marie Antoinette, sister of the Emperors Joseph II. and Leopold II.) was beheaded in 1793; Louis (Xavier), Comte de Provence, became Louis XVIII. (1815-24); Charles Philippe, Comte d'Artois (husband of Maria Theresa of Saxony), became Charles X. (1824-30); and the famous Madame Elizabeth perished in the Revolution. The only surviving son of Louis XVI. died in prison in 1795; his only daughter, Marie Thérèse, married the Duc d'Angoulême, the eldest son of Charles X., but without issue. The Duc de Berri, second son of Charles X., married Maria Carolina, daughter of Francis I. of Naples, and left one son, Henri, Duc de Bordeaux, Comte de Chambord, who married Maria Louisa of Modena, and is now entitled, on Legitimist principles, to the throne of France. So late as 1873 (Salzburg Letter) he declined to make any constitutional concessions. Besides the Comte de Paris, whom we mentioned as representing the Orleans branch, there are many representatives of the five sons of King Louis Philippe who would, on Legitimist principles, be entitled on the failure of the Comte de Chambord or his heir-male. Philippe of Anjou, dying in 1746, was succeeded on the throne of Spain by his sons Ferdinand VI. and Charles III. The eldest son of the latter succeeded in 1788 as Charles IV., but abdicated in 1808 in favour of Joseph Bonaparte. In 1814 Ferdinand VII., the son of Charles IV., was restored to the throne, and, the Salic law being abolished in 1830, was succeeded in 1833 by his daughter, Isabella II., under the regency of Espartero and the Queen-mother Christina. The second son of Charles IV. was Don Carlos, who, excluded by the abolition of the Salic law, asserted his rights in the rebellion of 1834-39, and bequeathed them to his son ('Carlo Settimo'), who, after solemnly renouncing all claim to the throne, has involved his country in civil war for the second time in the 19th c. Isabella had to withdraw in 1869, since when there have been two periods of republican rule, with an interval of the feeble King Amadeus (abdicated 11th February 1873). In 1874 the B. branch was restored in the person of Alfonso, the son of Isabella. The second son of Charles III. was Ferdinand I., who received the kingdom of the Two Sicilies, which his father had obtained at the conclusion of the Polish Succession War. Ferdinand, who, after submitting to the usurpations of Joseph Bonaparte and Murat, died in 1825, was succeeded by his son, Francis I. (died 1830), his grandson, Ferdinand II., and his great-grandson, Francis II. (Bomba), who was expelled by Garibaldi in 1860. The fourth son of Philip V of Spain was Don Philip, who in 1748 obtained the duchies of Parma and Piacenza, with clauses of return to Austria which never came into effect. His son, Ferdinand, entered into the Convention of 1801, by which the duchies were united to France. The son of Ferdinand was Charles Louis Ferdinand, who became King of Etruria, and whose son, Charles Louis (Duke of Lucca), obtained the duchies in 1847, on the expiry of the liferent of Maria Louisa, the ex-Empress of the French (a right she enjoyed under the Treaty of Paris). The attempts of Charles III. (assassinated 1854) and the Duchess Marie Thérèse (mother of Duke Robert) to govern with the help of Austrian troops were not successful; in 1859 the family was expelled, and the territory added to Sardinia, now Italy. See Coiffier-Demoret's *Histoire du Bourbonnais et des Bourbons* (2 vols. Par. 1828), and Achantre's *Histoire Chronologique et Généalogique de la Maison Royale de B.* (2 vols. Par. 1825).

Bourbon, Charles, Comte de Montpensier et de la Marche, Dauphin of Auvergne, and Duc de Bourbonnais, was born 17th February 1890, and eclipsed his contemporaries both as a politician and a soldier. The death of his elder brother, and his marriage with Susannah of B., put him in possession of the duchies of Bourbonnais and of Auvergne, and his great territorial influence was strengthened by his abili-

ties both as a statesman and a soldier. At the age of twenty-six, Francis I. made him Constable of France; in 1515 he gained the brilliant victory of Marignan, and within three weeks became master of Milan and Lombardy. His refusal to marry Louisa of Savoy, the king's mother, led to his being deprived of the estates he had received from his deceased wife and his mother-in-law, and by way of retaliation he formed an alliance with the Emperor Charles V. and Henry VIII. of England, from which the king in vain attempted to withdraw him. Having begun the siege of Marseille, the superior forces of the King forced him to relinquish it. Crossing the Alps, B., in the memorable battle of Pavia (25th February 1525), not only defeated Francis, but took him prisoner. Finding himself deceived by Charles V., he resolved to make himself independent in Italy, and on the 6th of May 1527, with an army unprovided with artillery, he appeared under the walls of Rome. In attempting to scale the walls, he was mortally wounded by a musket-ball, when he ordered his death to be concealed from the assailants. Two months later, his troops, who had meanwhile given themselves up to the pillage of the city, buried him at Gaeta. See Brantôme's *Vies des Grands Capitaines Étrangers*.

Bourbon, Ile de. See RÉUNION, LA.

Bourbon-Lan'cy, a town in the department of Saône-et-Loire, on the Loire, with mineral and hot springs, and many Roman remains. Pop. (1872) 1456.—**B. l'Archambault**, the *Aqua Bormonis* of the Romans, a town in the department of Allier, France, on the Barge, 15 miles W. of Moulins. It gave name to the family Archambault, has an ancestral castle of the Bourbons, a church of the 12th c., the remains of a feudal castle of the 15th c., with the celebrated tower of *Quinquengrogne*, and is noted for its hot springs. Pop. (1872) 2400.—**Bourbonne-les-Bains**, a town of France, department of Haute-Marne, on the Apance, celebrated for its hot saline springs, which are valuable in affections of the stomach and nerves. B. has a ruined castle and priory, a church of the 13th c., and some manufactures of tiles, plaster, and cutlery. Pop. (1872) 3949.

Bourbonnais, formerly a province of France, now comprising the fertile department of Allier and part of that of Cher. In 1327 it became the duchy of Bourbon, but was annexed to the crown in 1523. Moulins was the capital. See Allier's *Ancien B.* (Moulins and Par. 1839).

Bourbon Tea, or *Faham*, the dried leaves of the *Angraecum fragrans*, an orchid so called from being used as a substitute for tea in the Mauritius or Isle of Bourbon. It produces a soothing effect without causing sleeplessness, but is not much esteemed in London and Paris, into which it has been introduced.

Bourdaloue, Louis, one of the great French preachers, was born at Bourges, 20th August 1632, where, after being educated by the Jesuits for the Church, he lectured in the Academy for some time on humanity, theological ethics, &c. In 1669 he began to preach at St Louis (Jesuit Church), Paris, where Louis XIV. and his granddaughter soon brought the court to hear him. His popularity lasted many years. His sermons, based chiefly on the texts of Isaiah, St Paul, and St Augustine, were marked by profound moral earnestness and great logical power. They were delivered with shut eyes, and a sonorous but uninflected voice. B. advocated a return to primitive evangelism, and spoke plainly about the vices of the court. He was sent on a special mission to Languedoc on the revocation of the Edict of Nantes (1685), and there is no doubt that he was best fitted among the Catholic clergy to secure a hearing from the Huguenots. His later years were spent in the preaching and practice of charity. He died at Paris, 13th May 1704. His sermons were published by Bretonneau (18 vols. Par. 1707-34); recent editions are those of Méquignon (17 vols. Par. 1822-26), Lefèvre (Par. 1833-34), and Didot (Par. 1840). See Prigny's *Vie du P. B.* (Par. 1705); and Saint Arnaud's *Notice sur le P. B.* (Bourges, 1842). Mme. de Sévigné (*Letters*, 1674 and 1686) has left a striking picture of B.'s originality and power.

Bourdon de l'Oise, François Louis, a French revolutionist, born at Saint Remy, near Compiègne, about the middle of the 18th c. He was a procurator of the Parliament of Paris

ill 1789, when he embraced with ardour the cause of the Revolution. In 1792 he joined in the sack of the Tuileries; afterwards, as a member of the Convention, clamoured for the execution of Louis XVI., took part in the insurrection of 31st May, and latterly contributed to the downfall of the Girondists. Brutal and malicious in character, he deserted the cause of violence at the dictate of cowardice, and, as the reward of his perfidy, was banished by the Directory to Cayenne, where he died in 1797.

Bourg, the capital of the department of Ain, France, situated on the *Reysouze*, 70 miles N.E. by N. from Lyon. It is the birthplace of Lalande, the famous astronomer, and has a statue of Bichat the anatomist, and an obelisk in honour of General Joubert. Near it is the church of Brou, rich in sculpture and coloured windows. Pop. (1872) 10,647, engaged in manufacturing linen, cotton, leather, and hoisery, and in trading in field produce.

Bourgelat, Claude, the founder of veterinary schools, and the creator of hippiatric science in France, was born at Lyon in 1712. He first followed law as a profession, but afterwards abandoned it for the military service, where his natural liking for horses was fostered. He was thus instigated to study the diseases to which such quadrupeds are subject, and conceived the idea of educating men for the treatment of these. Assisted by Bertin, a minister of Lyon, he opened in 1772 a veterinary school, which at once became famous, and is so to the present day, notwithstanding the many similar institutions which have since been established in this and other countries. B. died at Lyon in 1799. He was a voluminous writer on the diseases incident to quadrupeds, on the methods of treatment, and similar subjects. His best-known work is *Traité de la Conformation extérieure du Cheval, de sa Beauté et de ses Défauts* (Par. 1776), which has been translated into several languages.

Bourgeoisie, a French term, from *bourgeois*, a dweller in a *bourg*, or burgh, now applied to the middle trading class, as distinguished from the aristocracy and operative class. *Bourgeois* is to be carefully differentiated from *citoyen*, which is applicable to all persons possessing the rights of citizenship, irrespective of their rank; in short, the former has a *social* and the latter a *political* signification.

Bourges, the capital of the department of Cher, France, situated at the junction of the Auron and the Yvette, 123 miles S. of Paris. This ancient and famous city occupies a large area, and is rich both in natural and artificial beauties. Its trade, however, is not important, consisting chiefly in a slight export of grain, hemp, skins, and timber. There are also some manufactures of cloth, some tanneries, and more recently a foundry and an arsenal. Of its buildings, the most notable are the cathedral (13th c.) and the town-hall, a striking edifice of the 15th c., the outside of whose walls is covered with Gothic carvings of a high order.

B. is the ancient *Avaricum*, in the country of the *Bituriges*, and was taken (52 B.C.) by Cæsar, who described it as almost the finest city in Gallia, with a strong natural position. Under Augustus it became the fortified capital of the Roman province of Aquitania, was called *Biturica* (of which its present name is a corruption), and in the middle ages was the chief town of the duchy of Berry. It was the birthplace of Louis XI. In 1438 the Pragmatical Sanction, which asserted the right of the Gallican Church to choose its own bishops, was confirmed by Synod at B. The town is rich in historical monuments both of Roman and mediæval times. Pop. (1872) 22,654.

Bourignon, Antoinette de, born at Lille, 13th January 1616, was a religious mystic, who held the opinion that the Bible was not a sufficient source of faith, but needed to be supplemented by special revelation. At Amsterdam she abjured Catholicism, and printed there her works at a private press. As a proselytiser she was very successful. After occupying the position of the head of an hospital first at Lille and then in E. Friesland, she died at Franeker, 30th October 1680. B. was accused of grave trickeries, and of a piety too interested to be genuine. Her works, collected by Poiret, and accompanied by a biography, were printed in 21 vols. at Amsterdam 1679-84; 2d ed. 1717.

Bourmont, Louis Auguste Victor, Comte de Ghaïsne de, was born at Château de B. (Maine-et-Loire), September 2, 1773, and was made an officer of the Guards when sixteen years of age. On the outburst of the Revolution he joined the Prince of Condé, and served with energy and spirit in the war of La Vendée, but subsequently he went over to Napoleon, who made him a general of division. On the first Restoration (1814), he returned to the Bourbon cause, but on Napoleon's reappearance again changed sides, and received the command of a division of the army in Flanders. Once more he deserted Napoleon, on the eve of the battle of Ligny, and again finally adopted the royal cause. After the second Restoration he was made commander of a division of Royal Guards (1815), a peer of France, and leader of the army in Spain on the withdrawal of the Duc d'Angoulême (1823), and Minister of War (1829). He was commander-in-chief of the army sent against Algiers, for the capture of which place he was made a marshal of France, July 22, 1830. The July Revolution having meantime broken out, B. refused allegiance to Louis Philippe, and had to leave the country. In 1833 he assisted Dom Miguel in his abortive attempt to seize the Portuguese crown, after which he retired to Rome, but returned to France on the peace of 1840. He died at the family château of B., October 27, 1846. See Merson's *Notice Biographique sur le Maréchal de B.* (Nantes, 1846).

Bourne, Hugh. See PRIMITIVE METHODISTS.

Bourne, Vincent, well known for the exquisite grace of his Latin poetry, was born at Westminster in or about 1696, and educated at Westminster School and Trinity College, Cambridge. He was chosen a Fellow of Trinity College, Cambridge, in 1720, and was for several years an usher in Westminster School. B. died 2d December 1747. Some of his poems appeared as early as 1721 (*Carmina Comitalia Cantabrigiensi*), but the first collected edition was published in 1739, under the title *Pœmata Latine partim reddita, partim scripta*, a ninth edition of which was published by Pickering in 1840. The volume contains Latin versions of Addison's hymns, of several old English ballads, and of many other and inferior compositions. These versions display not only B.'s wonderful power over the Latin tongue, but the remarkable tenderness and beauty of his genius. Cowper preferred him to Tibullus, Propertius, and all other Latin poets, except Ovid, and thought him not at all inferior to him. 'Well fare,' says Charles Lamb, 'the soul of unfastidious V. B., most classical, and, at the same time, most English of the Latinists!'

Bournouse, or **Burnus** (Arab.), a white mantle with hood, much worn by the Arabs of Algeria and Morocco, by the Bedouins in N. Africa and Arabia, and occasionally seen in Spain and France.

Bourrienne, Louis Antoine Fauvelet de, a well-known French author, was born at Sens, 9th July 1769, and studied along with Napoleon at the military school of Brienne, where the two formed an intimate friendship. B. first entered on a public career after the treaty of Campo Formio (1797), when he became Bonaparte's private secretary. After the Egyptian campaign he was made a Councillor of State, but lost his office and the confidence of Napoleon on the fraudulent bankruptcy of 'Maison Coulon.' He afterwards resided as *chargé d'affaires* at Hamburg, and embezzled large sums of public money, which was discovered. On the Restoration of 1814 he joined himself to Talleyrand, and received a post in the administration. Excepted by Napoleon from his Amnesty of Lyons, B. retired with Louis XVIII. to the Netherlands. He finally became a Minister of State, was in the *Chambre Introuvable*, and sat as a deputy for Yonne, until he had to run from his creditors. His reason then gave way, and he died in a *maison de santé*, 7th February 1834. His *Mémoires* concerning Napoleon, of the Directory, Consulate, Empire, and Restoration, in 10 vols., were published in 1829-31. They are detailed, but inaccurate.

Boussa, a town and district of Sudan, Central Africa. The town is naturally strong, being situated on a rocky island in the Niger, about 300 miles above the confluence of this river with the Chadda. Pop. estimated at from 10,000 to 18,000.

Boussingault, Jean Baptiste Joseph Dieudonné, an eminent chemist, was born at Paris 2d February 1802. After

being educated at the mining school of St Etienne, he went to S. America, where he fought under Bolivar. On returning to France, he was chosen Professor of Chemistry at Lyon, and afterwards Professor of Agriculture at the *Conservatoire* of Arts and Measures, Paris. He was elected to the Constituent Assembly in 1848, and made Commander of the Legion of Honour in 1857. The results of his scientific inquiries are contained in his *Economie Rurale* (2 vols. Par. 1844; 2d ed. 1849); English transl. by Law (Lond. 1845); and his *Mémoires de Chemie Agricole et de Physiologie* (Par. 1854).

Boussole's Strait, named after one of the vessels of La Perouse, passes through the Kurile Islands, and unites the Sea of Okhotsk with the Pacific Ocean.

Boustrophedon (Gr. *bous*, an ox, and *strephe*, I turn: literally, turning like an ox in the plough) is the term used to describe the early Greek manner of writing alternately from right to left, and from left to right. The laws of Solon were so written.

Bou'terwek, Friedrich, a writer on philosophy and poetry, was born 15th April 1765, at Oker, near Goslar, N. Germany. After studying jurisprudence and essaying poetry, he devoted himself to philosophy and the history of literature. He was made Professor of Philosophy at Göttingen in 1802, and died 9th August 1828. His chief work is his *Geschichte der Neuern Poesie und Redsamkeit* (12 vols. Gött. 1801-19), a work which, though of unequal merit, is yet a creditable monument of intellectual industry and independent judgment. In philosophy he was an adherent first of Kant and finally of Jacobi, and wrote treatises on the subject which are not remembered.

Bouts-Rimés (Fr. *rhymed ends*—of lines) is the name given to a particular sort of verse-making, which consists in fitting lines to appointed rhyming terminations. The diversion is said to have originated in a mishap which befell a French poetaster called Dulot. This man lived by writing sonnets for the courtiers of Louis XIV.; and it happened once that his MSS. were stolen. He bewailed his fate in having lost no fewer than 300 sonnets. On inquiry, it was found that these were *blank* sonnets, having only the rhymed endings. Hence originated the fashion, which appeared later in England. Horace Walpole relates how he had to fill up the rhymes *brook, I, crook, why*; which he did in this stanza—

'I sit with my toes in a brook, ●
And if any one asks me for why,
I gives 'em a tap with my crook,
And, 'tis sentiment makes me, say I.'

Bouvar'dia, a genus of plants of the natural order *Cinchonaceæ* (q. v.), natives of Mexico, one of which, *B. triphylla*, is commonly cultivated in flower-borders of our gardens. Its handsome red flowers are produced from June to November; but it ought to be placed in a greenhouse, frame, or dry cellar, to protect it from the winter frosts. *B. flava* (yellow flowers) and *B. longiflora* (white flowers) are also cultivated.

Bou'vet, Joachim, a French missionary, was born at Mans about 1662, and was sent by Louis XIV. on a scientific mission to China (a scheme favoured by Colbert, and, after his death, carried on by Louvois). On March 3, 1685, B. embarked at Brest, with five Jesuit fathers, and landed in China, 23d July 1687. Two of the fathers, detained in Pekin by the Emperor as teachers of mathematics, directed the building of the church and residence of the Jesuits in the capital. B. returned to France in 1697, bringing with him from the Emperor of China 49 Chinese volumes as a present to the King of France. Accompanied by ten new missionaries he again set out for China, which he reached in 1699. He died at Pekin, June 28, 1732, after having laboured long on a map of the empire. B.'s best-known work is his *Etat présent de la Chine* (fol. Par. 1697), some contributions to P. Duhalde's *Description de la Chine*, and a *Chinese Dictionary*, preserved in MS. in the Library of Mans.

Bouvines, a small place in French Flanders, to the S.E. of Lille, noted for two battles, the first fought 27th July 1214, between the Emperor Otto I. and Philippe Auguste, in which the latter was victorious; and the second, 18th May 1794, when

the Austrians, under Klinsky, were defeated by the French Republican Army of the North.

Bovey Coal, the lignite or wood-coal found at Bovey Tracey, Devonshire. It has a disagreeable odour, and is of little use except as fuel for burning pottery, and for brick and tile making.

Bo'vidæ, the family of *Ruminant* mammalia, which includes the various genera of *Oxen* and their allies. The animals of this group are generally of large size and heavy conformation. As in other members of the *Cavicornia* (or 'hollow-horned' Ruminantia), the horns are hollow, and consist each of a process of the frontal bone, or *horn-core*, covered by a horny sheath. These horns are generally borne by both sexes, and are not shed annually as in the Cervidæ or deer. In the B. the horns are usually turned outwards in a crescentic shape. The head terminates in a wide muzzle. The legs are strongly made. The skin of the neck is loose and hanging, and forms a large dependent fold, known as the *dewlap* . The tail is tufted. There are six incisors, two canines, and twelve molars in the lower jaw, and only twelve molars in the upper jaw; the place of the absent upper incisors and canines being taken by a callous or hardened pad of the gum. The females possess four teats. The B. occur in Europe, Asia, Africa, and N. America, and are represented as fossils only in the Pliocene and Pleistocene formations; the chief extinct forms being the *Urus* or wild bull (*Bos primigenius*), the *Bos antiquus*, the *B. longifrons*, together with the still existent bison or auroch (*B. bison*). See also ARNÉE, BANTENG, BISON, BUFFALO, OX, YAK, &c., &c.

Bov'ino (anc. *Vebinum*), a fortified town in the province of Foggia, S. Italy, 20 miles S.S.W. of Foggia, and close upon the railway, that here crosses the country. It is a bishop's see, and has a cathedral. The valley of B. has long been a favourite haunt of brigands. Pop. 6000.

Bow, a term used generally for the front part of a ship. 'On the port,' or 'on the starboard' B., are phrases used in reference to objects seen within about 45° of the vessel's course to the left and right respectively.

Bow and Arrow, the most ancient weapons of offence and of the chase used by the human family, and among all uncivilised tribes the most generally employed. Arrow-heads of flint, rudely chipped, are the earliest remains found indicating the beginnings of human life on the globe, and something of the development of the race can be traced in the improved form and finish of flint arrow-heads. The remains of bows have also been found in large numbers in the deposits of the ancient Swiss lake-dwellings. The bow with poisoned arrows is to this day the favourite weapon among savages everywhere. See ARCHERY.

Bowditch, Nathaniel, LL.D., F.R.S., an eminent American mathematician and astronomer, and President of the American Academy, was born at Salem, Massachusetts, March 26, 1773, and died at Boston, March 16, 1838. His two principal works are *The American Practical Navigator* (1802), and an excellent translation of La Place's *Mécanique Céleste* (4 vols. Bost. 1829-38).

Bowdich, Thomas Edward, African traveller, was born at Bristol, June 1790, where he was educated, and passed some time in his father's counting-house. In 1814 he visited Cape Coast Castle, of which his uncle, Mr Hope Smith, was governor, and in 1816 was placed at the head of an embassy to the Ashantees, of which he published an interesting account (Lond. 1819). He afterwards resided in Paris, and produced numerous original works on Africa, and a translation of Mollien's *Sources of the Senegal and Gambia* (1820). In 1822, accompanied by his wife, he sailed from Lisbon for Africa, intent on wide explorations, but on reaching the river Gambia he had an attack of fever and died, January 10, 1824. His wife prepared from his notes *Excursions in the Island of Madeira, by the late T. E. B., with a Narrative of his Last Voyage, Remarks on Cape Verd Islands, and a Description of the English Settlements on the Gambia* (1825).

Bow'er (Old Eng. *būr*, and still so pronounced in Lowland Scotch, *bour*; perhaps connected with the Gr. *burion*, a house), originally meant a dwelling, either the whole house or a single

chamber, but later on was restricted in its application to the private apartment of ladies in a feudal castle. In this sense it is often contrasted with *hall*, where the feudal retainers assembled for food or mirth; *v.g.*—

'What never yet was heard in tale or song
From old or modern bard in *hall* or *bower*.'

Copius (lines 44, 45).

The lady's attendants were called her 'B.-maidens.' The ballad poetry of Scotland abounds with examples of the use of the word.

Bowerbankia, a genus of Molluscoid animals belonging to the class *Polyzoa* or *Bryozoa*, and to the order *Infundibulata* or *Gymnolamata* of that class. In this order the tentacles are arranged in a circular form, and the mouth is not guarded by a valvular process or *epistome*. *B.* is included in the sub-order *Ctenostomata*, and is common around the British coasts, growing attached to sea-weeds, stones, &c. The tufts or colonies of this form (for like all *Polyzoa*, *B.* is a compound animal) may attain a height of 1 or 1½ inches, and may be matted and creeping, or erect and of irregularly-branched shape. The cells, each of which contains a little zoöid or animal, are of tubular form, and are thickly clustered together. Each little animal of the colony possesses from 8 to 10 tentacles, which are richly ciliated, and can be withdrawn into, or protruded from, the cell. The mouth opens in the central aspect, and a gullet, strong gizzard, stomach, and intestine belong to each animal. Certain cellular bodies are supposed to represent a liver. The tentacles bring particles of food to the mouth. No heart exists, but a circulation of fluid takes place in each cell. The nervous system is represented by a single nervous mass or ganglion placed near the mouth. Reproduction takes place by means of eggs, but the colony itself increases indefinitely by gemmation or budding. Complicated muscles for the retraction and protrusion of the tentacles exist. *B. imbricata*, and *B. densa* are familiar species.

Bower-Bird, the popular name of certain interesting Australian birds belonging to the Corvine family *Sturnida* (see **STARLING**), and so named on account of their constructing remarkable erections resembling bowers. These consist of a platform of twigs woven together, with other twigs fastened to it at the bottom, and curving upwards so as to meet at the top. These bowers are decorated with any bright-coloured or white objects the birds can procure, such as parrots' feathers, snail-shells, bones, coloured rags, &c. The aborigines are in the habit of looking in the bowers for any light and showy things they may miss from their encampments. The bowers are not used as nests, but as playing places, the birds chasing each other through and round them, often for hours at a time. The adult male *Satin B.-B.* (*Ptilonorhynchus holosericeus*) is of a deep purple hue, with glossy plumage resembling satin. The female and young male birds are of an olive-green colour. The *Spotted B.-B.* (*Chlamydera maculata*) makes larger bowers than the *Satin B.*, they frequently being a yard long. It is of a rich brown colour, with buff spots, and has a collar or cloak of long pink feathers on the neck, whence its scientific designation. These two species are natives of New South Wales. A larger species, the *Great B.-B.* (*Chlamydera nuchalis*), is found in N.W. Australia. The *B.* are partially insectivorous.

Bowie-Knife, a dangerous, sharp-pointed weapon, from 10 to 15 inches long, and a inches broad, named after its contriver, Colonel James Bowie, of the Southern States of America. It was long a favourite instrument with rowdies for settling their disputes, but its use is gradually being abandoned except by professed ruffians.

Bowing towards the Altar was no doubt originally an accommodation to Paganism, like so many more of the practices introduced into the early Christian Church. The pagans, whose religion was all more or less directly a worship of nature, always worshipped towards the rising sun. It was to meet the prejudice of converts; therefore, that the altar was placed in the E. end of Christian churches. But in modern times the practice of bowing towards it is connected with the doctrine regarding the presence of Christ in the Eucharist. See Bingham's *Ecclesiastical Antiquities*.

Bow Island, the largest coral island in the Low Archipelago, S. Pacific, accessible only in the N. through a small opening in

the reef, but affording a safe anchorage inside the barrier reef. This name was given by Cook, who visited the island in 1769, a year after Bougainville, by whom it was called *La Harpe*. The native name is *Hao*. *B. I.* is scantily peopled by a depraved race, engaged mostly in pearl-fishing.

Bowles, Rev. William Lisle, was born at King's Sutton, Northamptonshire, September 24, 1762, and educated at Winchester School and Trinity College, Oxford. His *Sonnets*, published in 1789, completely liberated from the artificial and conventional spirit of the 18th c., had a marked and merited success, and went far to inaugurate a new era in English verse. He may be regarded as the forerunner of the 'Wordsworthian' school, and was particularly admired by its chiefs. Coleridge, in a sonnet says:—

'No common praise, dear bard, to thee, I owe.'

After a quiet life as rector of Bremhill, in Wilts, *B.* died at Salisbury, 7th April 1850. He was a true poet of nature, and though not a classic, yet in virtue of his influence has a secure place in literature. His controversy with Byron and Campbell as to the poetry of Pope, whose works he edited, is well known. *B.* supported natural imagery in poetry, as against artificial, and is credited with victory by Hazlitt and other critics. Among his larger works are *The Spirit of Discovery, or Conquest of Ocean* (1805), and *The Missionary of the Andes* (1815). A new edition of his poems was published at Edinburgh in 1855.

Bowles, Samuel, a distinguished American journalist, was born at Springfield, Massachusetts, U.S., February 9, 1826, and since 1844 has been sole editor of the *Springfield Republican*, founded by his father. Under his management the paper has become one of the foremost journals in the country, and is noted for its extensive news, its literary taste, and its intelligent views of public affairs. In recent years it has laboured to free the press from the bias of political party. *B.* is author of *Across the Continent* (1865), *Our New West* (1867), and *The Switzerland of America* (1869).

Bowline, in nautical language, is a rope from near the middle of the weather edge, or leech, of a sail, to keep the leech firm. * The wind thus gets at the sail's after-side.

Bowls, Game of, one of the most simple, healthful, and popular recreations open to the community. The date of its origin is not known, but it has been traced by Strutt as far back as the 13th c. We may therefore say that, in some mode or another, it has been played in England for 600 years. After the middle of the 15th c., bowling became a common pastime in London and its environs. But we learn from Stow in his *Survey of London*, that the game was played in a roofed-in bowling-alley, as is still the prevailing form in England. Shakespeare repeatedly refers to it (*Twelfth Night*, *Shrew*, *Coriolanus*, &c.). Often attached to a tavern, the bowling-alley gradually degenerated till it became a haunt of the idle and the dissolute, and complaints were rife about its pernicious influence on the habits of tradesmen; and it is more than doubtful whether it can ever become a scene of pure and wholesome amusement. But within the present century, and particularly in Scotland, the game, played in the open air, and on a well-turfed green or lawn, as distinguished from the bowling-alley, has come to occupy a high position among popular recreations. At present the bowling-green may almost be considered as an 'institution' of the country. It is to be found in nearly every town N. of the Tweed, and is often laid out with exquisite beauty. It is gradually finding its way across the border, like another grand Scottish game, golf. Edinburgh has now a considerable number of bowling clubs, with many excellent greens, and not a few skilful players, but the W. of Scotland, especially Glasgow and Ayrshire, are the strongholds of bowling; and there, as also in the shires of Kirkcudbright and Dumfries, are to be found the finest greens, the greatest number of players, and the most admirable play.

A bowling-green should be laid with very fine turf, and be as smooth and as perfectly level as possible. It may vary in length from 30 to 35 yards. A width of 25 yards admits of three separate games being played at the same time, but the larger greens have sufficient width to accommodate from eight to ten rinks. The *B.* are generally made of *Agrostis alba*, a dense, heavy wood, are about 16 inches in circumference, and more or less oval in

shape. They have a bias given them by their inner side being made more flat than the outer, which causes the bowl to make a considerable bend or circuit in its course as it slows in approaching its destination. This bias, sometimes very considerable, enables a player to send his bowl round others which seem as if they must obstruct its passage, and the delicate calculation of the bias is an important element in the skill and beauty of the play. The surface of the bowl being very smooth, it runs easily along the green.

The game may be played by two or more persons, forming two opposing sides; eight players, four on each side, making a full party, or *rink*, as it is termed. A small wooden ball, painted white, perfectly spherical, and about three inches diameter, called the *jack*, is thrown more than half or nearly the whole length of the green. Each member of the rink plays two B., and the bowl or B. lying nearest the jack when all have been played are reckoned *shots* to that side by which they are played, the game consisting of 7, 9, 13, or 21 shots, as may be agreed on, the two last being the most common. One bowl is played by each side alternately, and when all have been played, and the number of shots to the winning side ascertained, the jack is thrown again, and a new *end* commenced as before; and so on till either of the opposing parties has gained the required number of shots, and thus become the winners. In the attainment of this object, every bowl which is played affords the opportunity of displaying a great amount of skill; the player at one time aiming to have his bowl close to the jack, and at another to land it at such a spot as may obstruct his opponent's play, or where it is likely to count a shot, should the position of the jack, which is movable, be changed by any future bowl striking it; and the player himself may be required, with his bowl, to move the jack a few inches or feet, as directed by his partners, to where one or more of their previously played B. may be lying; or, if the situation be desperate, to upset all previous calculations by a *run*; that is, by discharging his bowl with such force and precision that the jack and the B. around it may be scattered in all directions, and chance determine the issue. See Mitchell's *Manual of Bowl-Playing* (Glasg. 1864).

Bowring, Sir John, an English politician and scholar, was born at Exeter, 17th October 1792. Early in life he attained a high reputation as a linguist and a translator of the more ancient and the more modern popular poems of most of the countries of Europe. B. was the friend and subsequently the executor of Jeremy Bentham, a contributor from the first to, and for five years editor of, the *Westminster Review*. He sat in Parliament for the Kilmarnock Burghs from 1835 to 1837, and for Bolton from 1841 to 1849, distinguishing himself as an advocate of free trade. He was sent on various commissions by the British Government to inquire into the commercial relations of European states. In 1849 he was made British consul at Hong-Kong, and for his services in this capacity the honour of knighthood was conferred upon him. He was subsequently made governor of Hong-Kong, and on an insult being offered to the British flag (1856), B. caused certain Chinese forts to be fired on—a procedure which occasioned a ministerial crisis at home. In 1855 he concluded a commercial treaty with Siam, about which country he wrote a fine work, *The Kingdom and People of Siam*, and in 1861 reported on the commercial relations between Britain and Italy. He died November 23, 1872. B.'s works are numerous and varied, the chief, perhaps, being his edition, in 23 vols., of the works of his political master, Bentham, accompanied by a biography (Lond. 1843). See *Autobiographical Recollections of Sir J. B.* With a brief memoir, by L. B. Bowring (Lond. 1877). —**Edgar Alfred B.**, son of the preceding, born 1826, educated at University College, London, and successively private secretary to the Earl of Clarendon, Earl Granville, and Lord Stanley of Alderney, has won a fair place in literature as a translator of Schiller, Goethe, and Heine. He was returned to Parliament for Exeter in 1868, but lost his seat at the general election in 1874.

Bow'sprit, of a ship, is a large boom projecting over the stem, and carrying the forward sail. It is generally inclined at a small angle to the horizontal.

Bowstring Girder, a type of girder in which the upper member is arched, and the lower one horizontal. If the arch be (as it is in practice approximately) an arc of a parabola, and the load on the girder be uniformly distributed, the stress in the

lower member is a uniform tension throughout its whole length, and the horizontal component of the compressive stress in the upper boom is also the same at every point. Inverted bowstring girders are sometimes used, and other modifications of the same type.

Bowstring Hemp, or **African Hemp**, the fibres of *Sesuviera Zeylanica*, and other species of the genus, belonging to the natural order *Liliaceae* (q. v.).

Bowyer, William, an English typographer, born in Whitefriars, London, 19th December 1699, belonged to a family of printers. He was educated at Cambridge, and appointed printer of the resolutions of the House of Commons in 1729, an office which he held till his death, 18th November 1777. Among his more noteworthy publications are his *Works of Selden* (3 vols. 1726); *Novum Testamentum Græcum* (2 vols. 1763); and an edition of the *Lexicon* of Schrevelius, with considerable additions. His miscellaneous tracts were collected and published by his successor, Mr Nichols, who also wrote B.'s Life.

Box (*Buxus*), a genus of plants of the natural order *Euphorbiaceae* (*Spurge-worts*), with evergreen foliage, generally shrubs or small trees. The common B. (*B. sempervirens*), is a native of the S. of Europe and some parts of Asia, but is now extensively cultivated as an edging for garden plots. It is said to be indigenous at Boxhill in Surrey. In warm countries it will often attain a height of from 24 to 30 feet, though it rarely reaches more than half that height in this country. The variety cultivated for edging is known as the *Dwarf B.* The leaves have a peculiar and rather disagreeable smell, and bitter taste. Taken internally, they cause purging, and externally a decoction of them promotes the growth of hair. The firm, smooth, yellowish wood is greatly valued by the cabinet-maker and wood-engraver, and for the manufacture of various musical and mathematical instruments. It is sudorific in its properties, if taken internally in the form of scrapings. Spain, Portugal, Circassia, and Georgia are the countries from which we derive most of our boxwood. *B. Balearica*, the Turkey or Minorca B., also yields a fine timber valued for wood-engraving. Between two and three thousand tons of B. are annually imported into Britain. The common B. is the badge of the Clan McIntosh, while the M'Phersons have adopted the variegated variety as theirs.

Box-Days. In the Court of Session in Scotland, B.-D. are two days appointed by the judges in each spring and autumn vacation, and one day in the Christmas recess, for lodging papers ordered by the court towards the close of the preceding session. The first box-day is also the day on which judgments or 'interlocutors' of the Lords Ordinary, pronounced within twenty-one days of the close of the session, become final, unless a *Reclaiming Note* (q. v.) be 'boxed' on the first day. In the inferior courts, the sheriff must, under statute, before the end of each session, appoint at least one court-day during each vacation for despatch of all ordinary civil business, including the calling of new cases, and lodging, during the vacation, of papers required.

Boxing, *i.e.*, fighting with the fists, has for a very long time been a favourite practice in England of men and boys. With the latter it has been in especial favour at school, as a summary method of deciding a quarrel. It may seem to many that this practice of boys so determining their quarrels is a brutal one, which, as such, ought to be put a stop to by penalties of necessary severity. The advocates of the system, again, maintain that the training required in learning B. is good for the physical development, and that the amount of pain which one boy can inflict on another in a fair fight is in general no more than every boy is able to bear, and that it cannot do him any ultimate harm; further, that the fighting is a good moral as well as a good physical training, because the

Ancient Boxers.

is a good moral as well as a good physical training, because the

opinion of the school demands that the contest be conducted without loss of temper on either side, and with the strictest regard to the rules of fair play on both. There can, indeed, be no doubt that B. has hitherto formed an essential feature of those English playgrounds on which, according to the Duke of Wellington, the battle of Waterloo was won. As the foreign policy of England does not, however, seem likely to lead to many battles for the future, perhaps the physical training which led to the great victories of former times may now be regarded as superfluous. By the law of England prize-fighting is illegal, and if either of the combatants be killed, the killing is felony or manslaughter. But if under the ban of the law, there can be no doubt that a B.-match between two noteworthy pugilists still possesses almost irresistible attractions even for men of the upper classes in England. In our own time we have seen the extraordinary spectacle of both Houses of Parliament nearly emptied in order that members might behold an infraction of the law. This took place, 17th April 1860, at Farnborough, on the occasion of the famous B.-match between Tom Sayers, the champion of England, and John Heenan, 'the Benicia Boy,' an American. The prize was a stake of £200 on each side, and the 'champion belt.' The battle at the end of two hours was put a stop to by the police, each combatant claiming the victory. In the House of Commons the Home Secretary announced that the spectators as well as the principals had broken the law, and were consequently liable in penalties. No legal proceedings, however, followed this announcement.

Boxing-Day, the day on which Christmas-boxes are given to servants, messengers, &c. These presents are looked for the day after Christmas.

Boxing the Com'pass, i.e., repeating the thirty-two points of the compass in order. The origin of the phrase is not known.

Box'-Sextant, a modification of the nautical sextant, used to measure angles in surveying. The whole instrument is enclosed in a small cylindrical box, a few inches in diameter, so as to be very portable.

Box'tel, a Dutch town, province of N. Brabant, at the confluence of the Dommel and Beerze, 7 miles S. of Bois-le-Duc. It has eighteen linen factories, employing 260 weavers, and is noted for its beautiful diapers. Pop. (1873) 4225. B. was the scene of the defeat of the Anglo-Dutch army under the Duke of York by the French in 1794.

Box'-Thorn (*Lycium*), a genus of plants of the natural order *Solanaceæ*, of which several (thorny shrubs) are natives of the S. of Europe, and some are almost trees. *L. Europæum* and *L. fuchsoides* are among the cultivated species, the latter being used in its native country (the Andes of Quito) as a hedge plant—a purpose to which the former species is also sometimes applied in Spain and Tuscany.

Boya'ca, or **Bojaca**, a town and state of Colombia, S. America, situated 12 miles S. of Tunja, the capital of the state. Near B. Bolívar defeated the Spaniards, and secured the independence of Colombia in 1819. Area of state, 17,000 sq. miles; pop. (1870) 482,874.

Boy'au, in the nomenclature of siege-work, is a winding trench, which forms a communication between the different armed trenches. Its object is to prevent them from being fired upon in flank.

Boy-Bishop (*Episcopus Puerorum*), was elected on St Nicholas's Day (December 6), and his mimic jurisdiction lasted till St Innocent's Day (December 28). The ceremonies of the election were copied from those performed at the regular episcopal consecration. The B.-B. was usually selected from the cathedral choristers, and had a juvenile chapter who assisted him in his episcopal functions. The office was accompanied by substantial benefits. If a prebend became vacant during the period of his episcopacy, the B.-B. had the power of filling it. A proclamation of Henry VIII. prohibiting the election of the B.-B. was recalled in the reign of Mary. The custom has now dropped out of use. See Dr Rimbault's *Account of the B.-B. of Salisbury*, published by the Camden Society (Lond. 1875).

Boyd, Robert, of Trochrig, an eminent Scotch divine, was the son of James B., twelfth Archbishop of Glasgow, and

was born in that city in 1598. Educated in Edinburgh and France, he commenced teaching in the latter country at Tours, was ordained pastor at Verteuil in 1604, professor at Saumur in 1606, and was afterwards called by King James to the Principalship of Glasgow University, where he taught Hebrew, Syriac, and theology, and also preached every Sunday in Govan. He died 5th January 1627. Of B.'s works, the least unknown is his *Praelectiones in Epistolam ad Ephesios*. He was a fine Latin scholar of the old type, and had a genius for Latin verse which he did not sufficiently cultivate.

Boyd, Zachary, a Scottish divine, belonging to the family of the Boyds of Pinkell in Carrick, and cousin of Robert B. of Trochrig, was born before 1590, and educated first at Kilmarnock, afterwards at Glasgow, and at Saumur, France, where he became a regent or teacher in 1611. In 1621 he returned to Scotland, was appointed minister of the Barony parish, Glasgow, in 1623, where he died in 1653 or 1654. B. was thrice chosen rector of the university of that city, which he enriched with a considerable collection of books, and, for the period, a handsome legacy. *The Last Battell of the Soule in Death* (2 vols. Edinb. 1629), reprinted at Glasgow in 1831, and his *Psalmes of David in Meter* (Glasg. 1646), are the works by which he is chiefly known. His *Zion's Flowers*, a MS. collection of poems on subjects in scripture history, has from its quaintness acquired an exceptional celebrity among literary antiquaries. The soliloquy of Jonah within the whale's belly has often been quoted. Two lines will suffice as an example—

'What house is this, where's neither coal nor candle,
Where I nothing but guts of fishes handle?'

In spite of this grotesquerie there is some real poetry and much beautiful devotion in *Zion's Flowers*.

Boydell, John, born at Stanton, Shropshire, January 19, 1719, was apprenticed in London to Toms, the engraver, for seven years, and later became a printseller, and one of the most beneficent patrons of English art. He is best known as the proprietor of the 'Shakespeare Gallery,' a splendid collection of paintings by Opie, Reynolds, Northcote, and West, which, at a later period, were beautifully engraved, and published as illustrations of a magnificent edition of Shakespeare from Bulmer's press (4 vols. fol. 1792-1801). B. was made Lord Mayor of London in 1790, and the Guildhall still contains several fine paintings which he presented to the Corporation. At the time of the French Revolution his business became embarrassed, and in 1804 he disposed by lottery of the 'Gallery' and all his pictures and plates. He died December 11, 1804.

Boyer, Alexis, Baron de, a French surgeon, born at Uzerche, Limousin, 30th March 1757. In 1804 he became First Surgeon to Napoleon I., whom he accompanied on his campaigns; and after the Restoration was appointed Professor of Surgery in the Paris University and First Surgeon at the Hôpital de la Charité. B. died November 25, 1833. His chief works are his *Traité d'Anatomie* (4 vols. 1797-99) and his *Traité des Maladies Chirurgicales* (8 vols. 1814-22). The *Nouvelle Biographie Générale* contains a full notice of his life and works by M. Malgaigne, from which one can see that his position was greater than his merits.

Boyer, Jean Pierre, a mulatto president of the republic of Hayti, was born at Port-au-Prince, February 28, 1776, and educated in France. On his return to the island in 1792 he joined the army, and distinguished himself in aiding Pétion to found an independent republic. He was subsequently raised to the rank of major-general, was vested with the command of the capital, Port-au-Prince, and on the death of Pétion (1820) was unanimously elected his successor. Under B. the republic, which now embraced the Spanish or eastern portion of the island, was recognised by the European powers, and was acknowledged by France on payment of an indemnity to the old planters of 150 millions of francs (£6,000,000). For an unwonted period the new rule was one of great tranquillity, but no effort was made to improve the lot of the negro, and in March 1843 a victorious rising took place. (See HAYTI.) B. fled on board an English man-of-war ship to Jamaica, where he continued to reside for some considerable time. He afterwards came to Europe, and died at Paris, July 9, 1850. Arrogant and tyrannous to his subordinates, B. was nevertheless a master of craft and courtesy.

Boyle (Ir. Gael. *Bacghill*, named after a famous Irish chieftain, ancestor of the O'Boyles), a town of Ireland, Roscommon county, on the B., 18 miles S.S.E. of Sligo. It is a station on the Dublin and Sligo Railway, and has a large trade in dairy and farm produce. Pop. (1871) 3161. Its annals, in Latin and English, which date from 420 to 1245, have been published. Near B. are the ruins of an abbey, built in the 12th c.

Boyle, Charles, third Earl of Orrery, born at Chelsen, 1676, educated at Oxford, and chiefly known for his edition of the *Epistles of Phalaris*, the work mainly of Atterbury, Friend, and others. It was published in 1695, extolled by Sir William Temple, and merclessly exposed by Bentley in his celebrated *Dissertation*. A controversy ensued, in which Bentley was completely victorious, showing that the Epistles were not written in the 6th c. B.C., but in the 2d c. A.D. B., who served for some time in the army, and was employed as an ambassador, was made an English peer, wrote some verses and one comedy, and died 28th August 1731. The name 'Orrery' was given in honour of B. to the instrument of this name by the inventor, Graham.

Boyle, Richard, first Earl of Cork, was the son of a Herefordshire gentleman, and was born at Canterbury, 3d October 1566. After completing his education at Cambridge, he joined the Middle Temple, but in 1588 went to Dublin to push his fortune. Seven years later he married a very wealthy lady, who, on her death in 1599, left him her whole estate. B. now began to invest extensively in the purchase of land. The envy or malice of other proprietors soon involved him in troubles, and he was even thrown into prison for a time in England, but at last obtained the ear of Elizabeth, who sent him back to Ireland with special marks of the royal favour. He obtained the confidence and friendship of Sir George Carew, Lord-President of Munster, who consulted him on all matters of political importance. In 1612 he was sworn a privy councillor of Ireland, in 1616 he was created Lord B., and in 1620 Earl of Cork. In 1629 he became Lord-Judge of Ireland, and in 1631 was made Lord High Treasurer of the kingdom. He displayed great vigour and courage on the outbreak of the Irish rebellion. B. died 15th September 1643.

Boyle, The Hon. Robert, seventh son and fourteenth child of Richard B., the first Earl of Cork, was born January 25, 1626, at Lismore, Waterford. After finishing his studies at Eton, he spent six years on the Continent, whence he returned in 1644, after his father's death. For the rest of his life he applied himself chiefly to science; and he was among the first members of that scientific association which, after the Restoration, received the name of the Royal Society. As a Director of the East India Company, he exerted himself greatly for the propagation of Christianity in the East. Another example of his religious tendencies is his bequest for the foundation of the 'B. Lectures' (q. v.). After a gradual decline, he died at London, December 30, 1692. B.'s works, among which may be mentioned *Medicina Hydrostatica*, *The Christian Virtuoso*, and *Experimenta et Observationes Physicæ*, were published, together with his *Life and Correspondence*, by Dr Birch (5 vols. Lond. 1744).

Boyle Lectures, *Thæ*, were founded by the Hon. R. Boyle (q. v.). The lecturer is to be appointed for a period not exceeding three years, and to deliver annually eight sermons, 'to prove the truth of the Christian religion against infidels, without descending to any controversies among Christians themselves; and to answer new difficulties, scruples, &c.' The first series was delivered by Richard Bentley (1691-92); and a collection of such as were preached between that time and 1732 was published in 1739. In 1802 the practice was begun of publishing them regularly.

Boyle's Fuming Liquor, or *Volatile Liver of Sulphur*, is obtained by distilling a mixture of 1 part of sulphur, 2 of sal-ammoniac, and 2-3 of quicklime. It is a dark yellow liquid, possessing the disagreeable odour of rotten eggs. It consists of a mixture of different *sulphites of ammonium*.

Boyle's Law, also known as *Marriott's Law*, expresses that at constant temperature the volume of a gas is inversely proportional to the pressure. It was first proved experimentally by Robert Boyle (q. v.).

Boynes, a river in the E. of Ireland, rises in the Bog of Allen, Kildare, flows through King's county, Meath, and Louth,

and enters the Irish Sea four miles below Drogheda, after a course of 65 miles and a total fall of 336 feet. The Deel, Mattock, and Blackwater are its tributaries. Near Oldridge is an obelisk 150 feet high, marking the scene of the battle of the B., in which William III. defeated James II., July 1, 1690.

Boys' Ships. See SHIPS, TRAINING.

Bozza'ris or **Botzaris**, **Marcos**, the hero of the Greek War of Independence, was born of a warlike family of Suliots, in the valley of Acheron (Janina), in 1788. In 1820 he issued from the Ionian Isles, the retreat of the expatriated Suliots (q. v.), at the head of 800 men, combined with Ali Pasha against the Sultan, and after the death of the former (1822) continued the war with unabated vigour. He was soon reinforced by Prince Mavrocordato with a disciplined force, but treachery led to the loss of the battle of Petta (July 16, 1822), after which the Greeks retired upon Mesolonghi. In the following summer B. anticipated the approach of the enemy, and by a brilliant night-attack, with only 1200 men, destroyed a Turco-Albanian army 4000 strong. But in this victory B. fell (August 20, 1823), leaving behind a name still extolled in many a Greek song.—**Kosta** or **Konstantinos B.**, brother of the former, also distinguished himself in the patriotic wars of Greece, was subsequently a general and senator, and died at Athens, November 13, 1853.—**Dimitri B.**, the only son of Marcos, has been Minister of War under King Otto since June 22, 1859.

Bozz'olo, a town of N. Italy, province of Mantua, on the Oglio, 16 miles W. by S. of Mantua, and 1½ miles S. of the railway between Mantua and Cremona. It has an annual fair and some silk-weaving, and was at one time a small independent republic. Pop. 5000.

Brà, a town of N. Italy, province of Cuneo, 25 miles N.E. by N. of Coni. It is an important railway junction, with metal foundries, silk and linen factories, and an active trade in cattle, wine, grain, fruit, &c. Pop. 12,500.

Brabançonne, the Belgian national song, first sung during the Revolution of 1830. It was composed by Jenneval, a young French actor, then engaged at the Brussels theatre, and set to music by Campenhout, afterwards Director of Music in the Chapel Royal. The refrain contains a pun on the title of *Orange* held by the royal house of Holland—

'La mitraille a brisé l'orange
Sur l'arbre de la liberté.'

Brabant' (Old Ger. *Brachbant*, 'the ploughed district'), formerly a powerful duchy, situated in the centre of the Low Countries, and now divided into (1) the Dutch province of North B., containing 1960 sq. miles, and (1873) 443,045 inhabitants; (2) the province of Antwerp, in Belgium, which contains 1094 sq. miles, and (1872) 497,017 inhabitants; and (3) South B., also in Belgium, with 1260 sq. miles, and a population (1872) of 887,905. The country is flat, but slopes gradually in a N.W. direction, and is well cultivated and fertile, being watered by the Maas and the Scheldt, with their many tributaries, and intersected by numerous canals. It has also flourishing industrial centres, as Brussels, Antwerp, Bois-le-Duc, the products chiefly consisting of linens, lace, cottons, and leather. In the N. the inhabitants are Dutch, and in the central part Flemish, while the S. district is the principal residence of the Walloons. Cæsar found B. occupied by a mixed German-Celtic race. In the 5th c. it came under the Franks, and on the division of the Frankish kingdom in the 6th c. it formed part of Austrasia. In the 9th c. it was united to Lothringen; in 890 to France; in the 10th c., through the German king Heinrich I., again to Lothringen, together with part of which it was joined to Germany in 959. The line of Dukes of Lower Lothringen died out in 1005, and B. was subsequently governed by several princes of the Ardennes; after 1076 by Godfrey of Bouillon. Heinrich V. bestowed B. on Godfrey of Bârtigen (born 1140), descended from the princes of Louvain and Brussels, who founded a dynasty lasting till 1355, and the title of Duke of B. was first taken by Heinrich I. in 1190. Later on, B. shared the fortunes of the Netherlands, but became part of Holland by the Treaty of Vienna, 1815. At the insurrection of 1830, however, South B. threw off the Dutch yoke, and united itself to Belgium.

Braccio Fortebracci, Count of Montano, an Italian condottiere, was born at Perugia in 1368. In 1408 he rendered valuable services to Ladislaus, King of Naples, which were subsequently ungenerously repaid by expulsion from Perugia, of which, however, B. gained the sovereignty in 1416. In 1417 B. obtained temporary possession of Rome, entered about 1420 the service of Joanna, Queen of Naples, who created him Prince of Capua, and died 5th June 1424, in consequence of wounds received three days before in a battle for the relief of Aquila, which he was then besieging. The followers of Sforza and of B. formed rival schools of warriors, known as the *Sforzeschi* and the *Bracceschi*, and their rivalry culminated in the most profound hatred. See Antonio Campano's *Vita di B.*

Brace, a carpenter's tool, used—along with borers of various shapes, called bits—to make holes in wood.

Bracelet, an ornamental ring or band worn upon the wrist or upper arm (Fr. *bras*; Lat. *brachium*). The fashion of wearing bracelets is one of very high antiquity, and is common to almost every nation; and though among modern civilised nations the B. is a form of female adornment, in bygone times, and still among savage tribes, it was used by both sexes alike. Chivalrous conduct on the part of Greek and Roman soldiers was acknowledged by the presentation of a B.; and among the Scandinavians and Saxons this ornament formed a suitable tribute of esteem. The *tumuli* of the ancient Britons have furnished numerous examples of bracelets composed of bone, ivory, bronze, and other metals; they have also been plentifully found in the peat bogs of Ireland. Previous to the Norman incursion into Britain, bracelets were worn by Saxons of both sexes, but after that event their use was almost entirely abandoned by men, and to some extent even by women. During the three centuries immediately thereafter, the B. was not much in favour as a personal ornament; but in the 16th c. the fashion among ladies of wearing short sleeves led again to its adoption, and since that time the B. has retained its popularity as an ornament of luxury. It assumes a great variety of forms, and is frequently made of the most costly materials, enriched with gems and precious stones.

Braces, in roofs, bridges, and other structures, are bars (which may be either *struts* or *ties*) used for stiffening the principal members. All the common forms of girders consist of an upper and lower member (or boom) connected by bracing, which in this case has to be strong enough to resist the shearing stress caused by the load.

Brache, a term of uncertain meaning, applied to a dog. It is supposed to have meant a bitch of the hound kind. If the word be from the Celtic *brac*, a spot, it might signify a spotted hound.

Brachial Artery, the main artery of the arm, is a continuation of the axillary artery (see *AXILLA*), commences at the lower border of the fold of the armpit, and about half an inch below the elbow divides into the radial and ulnar arteries. It lies on the inner border of the biceps muscle. At first it is on the inner side of the arm, and afterwards lies more in front. In the case of bleeding from the hand or forearm, and during operations below this vessel, the B. A. is easily compressed against the bone.

The B. A. gives off four named branches—(1) Superior profunda artery, which, along with the muscular spiral nerve, winds round the arm to the back; (2) the inferior profunda artery, which, along with the ulnar nerve, runs to the neighbourhood of the elbow; (3) the nutrient artery of the shaft of the humerus; and (4) the anastomotica magna, which meets with arteries of the forearm around the elbow-joint.

Brachialis Anticus is a broad muscle covering the front of the elbow-joint and lower half of the Humerus (q. v.). It arises from the middle of the humerus, and is inserted into the Ulna (q. v.). Its chief action is to flex the elbow-joint, which it does in conjunction with the biceps muscle. The B. A. helps also to protect the elbow-joint.

Brachiate, when opposite branches are decussate, i.e., one pair crosses over the pair below it in a cross-shaped manner.

Brachiopoda (Gr. 'arm-footed'), a class of *Mollusca* or Lower *Mollusca*, formerly denominated *Palliobranchiata* (or

'mantle-breathers'), under the erroneous impression that the Mantle (q. v.) which forms the shell was the chief agent in respiration or breathing. These forms possess *Bivalve* (q. v.) shells, which are placed dorsally and ventrally, the dorsal or upper valve being generally the smaller, and in many cases containing a series of limy loops (*carriage-spring apparatus*) for the support of the arms. These latter structures

Brachiopoda.

are two in number, one stretching away from each side of the mouth. They are characteristic of the brachiopods, each consisting of a prolongation of the mantle, furnished with *cirri* or stiff processes, and with *cilia*. Their functions are those of *breathing* and of drawing particles of food towards the mouth. The shell is opened and shut by means of special muscles. A heart and digestive system exist, and a single nervous mass or ganglion is developed. The B. are but sparsely represented in existing seas, but over 2000 fossil examples are known. The *Silurian* system of rocks is sometimes known as the '*Age of Brachiopods*,' from the abundance in them of these molluscs in a fossil state. All are marine. Living genera are *Terebratula*, *Crania*, *Discina*, *Lingula*, &c. Among fossil genera, *Producta*, *Spirifer*, &c., may be mentioned. These forms chiefly occur in a living state in Australian and adjacent seas. See also *BIVALVE*, *SHELL*, *MOLLUSCA*, &c.

Brachyptera, or **Brevipennatæ** ('short wings'), the name given to a section or family of *Natatorial* or swimming birds, represented by penguins, auks, divers, guillemots, grebes, &c., in which the wings are short or rudimentary, and sometimes useless for flight (penguins); the tail short, and the legs placed far back on the body. The wings, when useless for flight, may still (as in auks, &c.) form very efficient aids in diving and swimming.

Brachyura ('short tailed'), a division of the *Decapodous* order of Crustacea, represented by the various kinds of crabs. These possess a rudimentary abdomen, which is tucked up beneath the broad body or *cephalothorax*, consisting of the united head and chest. The rudimentary abdomen is not provided with appendages, and is used, in the case of the female animals, to carry the ova or eggs. The B. generally undergo a metamorphosis—the common crab first appearing as a tailed form (*Zoea*), next as a *Megalopa*, and lastly as the perfect crab, with a rudimentary abdomen.

Brack'et, in classical and mediæval architecture, is an ornament in the shape of a console standing isolated on the face of a wall. Their use is to support a statue or bust. Recently brackets made of wood, and covered with leather ornamentally stamped, have come much in vogue. The name B. is also applied to a projecting gaspipe.

Bracklesham Beds, the name given in England to that part of the Eocene deposits which overlie the 'London Clays.' They are the equivalent of the *Calcaire Grasse* of the Continent, and are very fossiliferous. The best examples are found in the Isle of Wight and in Hampshire.

Bract. In many plants the flowers spring from the axils of leaves (floral leaves), differing in no appreciable degree from ordinary leaves. But in others the leaves from the axils of which the flowers rise have a regular gradation from ordinary leaves up to what are called *bracts*, these bracts being, however, veritable leaves, which, as they ascend the stem, change their form and coloration, until the uppermost not unfrequently assume the appearance of petals (Brown). In structure they also affect the character of leaves. Sometimes, as in *Salvia fulgens*, *Amherstia nobilis*, &c., the bracts attain great development, and in brilliancy exceed the flowers

Bracket, Melrose Abbey.

themselves. When the floral axis branches, secondary bracts or *bracteoles* are often seen at its ramifications.

Braddock, Edward, an unfortunate English general, who commanded against the French in America in 1755. On the 9th of July of that year, while in command of a force of 2000 British and colonial troops, he fell into an Indian ambush near Fort Duquesne (now Pittsburg, Pennsylvania), while he was attacked by the French in front. B. was mortally wounded, and died four days after the engagement; and half of his men perished, the remainder escaping under his aide-de-camp, Colonel Washington, afterwards the hero of the War of Independence.

Braddon, Mary Elizabeth, a popular novelist, daughter of Mr Henry B., a solicitor, himself addicted to light literature, was born in Soho Square, London, in 1837. At an early age, she began to contribute to magazines both in prose and verse, but it was not till 1862, when she published the novel *Lady Audley's Secret*, that she became famous. By this, and a host of fictions that have succeeded it, she has established the right to be considered the first of writers of 'sensational' novels, which depend mainly for their success upon startling situations and a skilfully evolved plot. In some of her later works, Miss B. has shown considerable power of humorously sketching character. She conducts a London magazine called *Belgravia*, contributes to the newspaper press, and in 1873 came before the public as a dramatist with the play of *Griselda*.

Bradford (Old Eng. *Brddanford*, 'broad ford'), a manufacturing town in the W. Riding of York, on a tributary of the Aire, 8 miles W. of Leeds, and 34 miles S.W. of York. It is a station on the Leeds, Bradford, and Halifax Junction Railway, by which it is brought into connection with the Great Northern, Lancashire, and Yorkshire, London and North-Western, and other lines. It is the chief seat and mart of the worsted manufacture in England; mixed fabrics of wool and silk, and wool and cotton, are extensively wrought, and there are also cotton and silk manufactures. The Saltaire Alpaca and Mohair Mills, erected on the Aire, three miles from B., by Sir Titus Salt, employ 4000 men, and form the most extensive manufacturing establishment of the kind in the kingdom. There are nearly 200 mills in B., and these employ 40,000 hands, a majority of whom are immigrants. In the vicinity there is much coal-mining and iron-smelting. Among the public buildings are St. George's Hall, the Exchange, with a clock-tower and spire 150 feet high, the County Court, the churches, new theatre and music hall (1875), new corporation markets (1874). The Thornton Viaduct at B. is a fine piece of masonry. The Wesleyans, Baptists, and Independents have here colleges. B. has several fine public parks. A statue to Sir Titus Salt was erected in 1874. B. returns two members to Parliament. Pop. (1877) 173,723. During the civil wars B. was stormed by the royal forces under the Earl of Newcastle.

Bradford Clay, a pale, greyish clay, enclosing bands of impure limestone, the middle member of the upper division of the W. of England Lower Oolites, corresponding in age with the limestones of the Great Oolite, and abounding in the peculiar fossil the *Apicrinella*, and in one or two species of *Terebratula*. Maximum thickness, 60 feet.

Bradford, Great, a town in Wiltshire, on the Avon, 6 miles E.S.E. of Bath. It is a station on the Great Western Railway. Pop. (1871) 4871, engaged to a considerable extent in the manufacture of broadcloth, for which the town has been noted for several centuries. The origin of the trade is said to be owing to the settlement of Flemish weavers here in the reign of Edward I. St Aldhelm, in the beginning of the 8th c., founded an abbey here. It is mentioned in the *Chronicle*, under 652, as the scene of a battle between Cenwulf, King of the West Saxons, and his kinsman Cuthred.

Bradford, William, second governor of Plymouth Colony, was born at Austerfield, Yorkshire, 1588. He had a good patrimony, and is one of the few early pilgrims who can be clearly shown to have had a gentle ancestry in England. B. came with the first colonists in the *Mayflower*, 1620, was the second governor of Plymouth Colony, New England, and died May 9, 1657. He is the author of a *History of the Colony*.

Bradley, Dr James, a distinguished English astronomer, was born at Sherborne, in Gloucestershire, in 1692. After gra-

duating at Oxford, where he had studied for the Church, he obtained in succession the livings of Brideslow and Welfric, in Pembrokeshire; but after his election as a Fellow of the Royal Society in 1721, he devoted himself wholly to science, and became Savilian Professor of Astronomy at Oxford. In 1741 he succeeded Halley as Astronomer-Royal, and received the honorary degree of D.D. from Oxford University. He died July 13, 1762. B.'s greatest discoveries are the Aberration of Light (q. v.), and the variation of the inclination of the earth's axis to the ecliptic.

Bradshaw, John, a keen and conscientious, but somewhat narrow Puritan, was born in Cheshire in 1586, studied law at Gray's Inn, and soon became known as an able chamber counsel. In the struggle between King and Parliament he took the side of the latter, like his cousin Milton; became, in 1647, Chief-Justice of Chester, and in 1649 earned for himself a lasting name in history by presiding at the high court which tried and condemned Charles I. B. was handsomely rewarded for his services on this occasion, but he resisted Cromwell and the army, and was opposed to the Protectorate. Under Richard Cromwell he became Lord President of the Council of State. He died November 22, 1659. During the retaliatory persecution of the Puritans in the reign of Charles II., his body was exhumed, and hung on a gibbet, with those of Cromwell and Ireton.

Bradshaw's Railway Guide was first published in 1841, and is therefore the earliest, while it is also the best existing, of our many manuals of information for the traveller. It was founded by George Bradshaw, a printer and engraver of Manchester, who died in 1853. In its present form, extending to some 400 pages, it is published on the 1st of each month, and contains the newly-arranged tables of the various railway companies, besides a vast amount of valuable information relative to travelling by land or sea. It has been followed by publications of a similar character in France, Germany, America, and even in Australia. *B.'s Continental Railway Guide*, a companion volume for the various countries of Europe, containing also a handy topographical section, was first issued in 1847, and still continues to increase in size and in circulation. A regular series of handbooks, bearing Mr Bradshaw's name, is in course of issue, of which there have already appeared *France, Switzerland, the Overland Journey*, and the *Indian Presidencies*.

Bradypus. See *SLOTH*.

Braemar, a subdivision of the old district of Mar, in the S.W. of Aberdeenshire, remarkable for the romantic grandeur of its scenery. It lies among the Grampian Mountains, and contains, among other heights, Ben Macdui (4296 feet), Cairntoul (4245), Braeriach (4225), Cairngorm (4090), Ben-a-Buid (3869), Ben Avon (3826), and Lochnagar (3786). The predominating rocks are granite and gneiss. Alpine plants occur, and there is abundance of game, chiefly red-deer, roe, grouse, and ptarmigan. B. contains the head-waters of the Dee, and is traversed by General Wade's great military road from Blairgowrie to Fort George. Area of the united parish of B. and Crathie, 182,257 acres; pop. (1871) 1566. Balmoral (q. v.) lies towards the E., and in the heart of the parish is the village of Castleton, the great resort of visitors.

Braga, the capital of the province of Minho, Portugal, situated between the rivers Cavado and Deste, 35 miles N.E. of Oporto, in a malarious country. It is surrounded by old walls, beyond which several suburbs have spread, while it is further guarded by a castle, and is the residence of the Primate of Portugal, having a Gothic cathedral, an archbishop's palace, a large hospital, besides seven churches and many monasteries. The manufactures are chiefly linen, hats, jewellery, cutlery, and firearms. Pop. (1864) 19,514. B. is the Roman *Bracara Augusta*; became the capital of the Suevian kings, who here accepted Catholicism, A.C. 563; later on fell into the hands of the Arabs, but was captured by the army of Old Castile in 1040. It was long the residence of the kings of Portugal, and has still many Roman remains.

Braganza, or **Bragança**, the capital of the province of Traz-os-Montes, Portugal, on the Fervença, a branch of the Sabor, 92 miles from Oporto, in the N.W. angle of the kingdom. It has a strongly fortified castle, and is a centre of the Portuguese silk trade. B. was long the residence of the Dukes

of B., and gave name to the present royal dynasty. Pop. 3650.—**B.**, or **Oayté**, a seaport in the province of Para, Brazil, at the mouth of a river of the same name, about 100 miles E.S.E. of that of the Amazon, with a pop. of 6000.—**B.**, a town of Brazil, province of San Paulo, 95 miles N.N.W. of the port of Santos, and the terminus of an inland railway. Pop. 5000.

Bra'gi, in the Norse mythologic system, was the god of eloquence and poetry. In the prose *Edda* it is said that 'not only is B. especially skilled in poetry, but the art itself is called from his name *Bragi*, this word also meaning poet or poetess.' B. was the son of Odin and Frigga, his wife being Iduna. He is the Scandinavian Apollo, but is represented as an old man, not as a youth.

Braham, John, one of the greatest English tenor singers of his day, was born in London, of Jewish family, in 1777, and died February 15, 1856. He was most celebrated as a concert singer, and especially as a singer of national or patriotic songs. Some of his best songs were of his own composition, as 'The Death of Nelson,' 'The Cabinet,' 'False Alarms,' 'The Devil's Bridge,' &c.

Brah'e, Tycho, a distinguished Danish astronomer, was born at Kundstorph, December 14, 1546. After studying for a few years at Copenhagen, he was sent by his uncle to Leipsic in 1562 to attend the law classes; but astronomy had greater attractions for him, and on his uncle's death he devoted himself wholly to this science. After spending some years in travel, B. returned to his native country, and soon obtained the patronage of the king, who subsequently built for his use a commodious observatory called Uraniberg on the island of Hoen, in the Sound. On the death of the king in 1588, B.'s position was changed, and in 1597 he was forced to leave the country. Having obtained the protection of Emperor Rudolf II., he settled at Prague, where he died, October 13, 1601. The great merit of B. as an astronomer lies in the rare industry and assiduity with which he observed and recorded the positions of stars and planets, and it was entirely due to these observations that Kepler was led to the conception of his three famous laws. For his theory of the solar system, see ASTRONOMY. His *Opera Omnia* were published at Frankfurt in 1648. See the biographies of B. by Gas-sendi (Par. 1655), Helfrecht (Hof. 1798), and Pedersen (Copen. 1838).

Brah'ma, or **Brahm**, the Self-existent or Supreme Being of the universe, according to the Hindu religion, from whom all other beings—the deities, men, the world—derive their existence. Other names are Parabrahma, Paratma, Ram, Bhas-savat.

Brah'mā, an emanation from the preceding, whose worship is taught in the Institutes of Manu, and who is the first person of the Trinity of modern Brahminism—B., Vishnu, Siva, the creating, preserving, and destroying principles. B., however, though once supreme, is but little worshipped now; he has but one temple in all India, Vishnu and Siva having attracted all the veneration. He is represented with four heads and as many arms, and in pictures is often painted red. See HINDUISM AND INDIA, RELIGIONS OF.

Brah'man, or **Brah'min**, a member of the highest caste or priesthood of the Hindu religion, from which name the latter is also called Brahminism.

Brahmanbe'ria, a town in the executive district of Tip-perah, province of Bengal, British India, about 270 miles N.E. of Calcutta, with which it has easy access by sea and by railway, extending from Calcutta (1874) in a N.E. direction 120 miles to Goalunda. Pop. (1872) 12,364.

Brahmapu'tra ('offspring of Brahma'), one of the largest rivers of Asia, rises in Tibet, and after an entire length, reckoning from the source of its great affluent the Tsanpu or Sanpu, of 1800 miles, enters the Bay of Bengal through the mouths of the Ganges. The branch long regarded as the main stream, and still called B. Proper, rises in the most easterly of the Himalayas, and flows W.S.W. for 200 miles before uniting in Assam with the Sanpu, which springs from the same swamp as the Sutej and the Indus, on the N. of the Himalayan range, and which has a

previous course, in an E. and S. direction, of about 1000 miles. The latter was little known, till recently, beyond the portion which, under the name of the Dihong, divides British India from Tibet for about 150 miles. After the confluence of the two branches, the B. flows S.E. for nearly 350 miles, sweeps round the Garo Mountains, then takes a S. course, and joins the Ganges near Goalundo, ultimately reaching the sea by a hundred mouths, of which the Waghna estuary is the chief. Drainage-area estimated at 360,000 sq. miles. The B. has few great tributaries or large towns upon its banks. It is navigable by steamers to the furthest corner of Assam, and forms the one means of communication between that remote province and the outer world.

Brah'min Ox, or **Zebu** (*Bos Indicus*), a species of *Bovida* (q. v.), or oxen, representing the domestic cattle of India. A prominent fatty hump is borne on the withers, and the dewlap is very pendulous. The limbs are slender, and the back slopes towards the tail. These animals are very lithe and active, and are used as beasts of burden, and in carriages. They are also found in China, Madagascar, and E. Africa. The B. O. is sacred to Brahma (q. v.).

Brahmin Ox.

Brahmo Somaj, 'or Theistic Church of India, may be said to have been founded at Calcutta, in January 1830, by Ram Mohun Roy, the enlightened Brahmin who procured the abolition of suttee, and constantly wrote against the prevailing idolatry, which he declared to be a perversion of the pure monotheism found in the Vedas as well as in Mohammedan and Christian scriptures. As the Vedic readings in the 'Society of God' (at first called Brahma Subha or Brahmiya Sumaj) were confined to those of the Brahmin caste, no great progress was made until 1843, when Debendra Nath Tagore, a wealthy Brahmin who had previously started the Tattvabodhini Sabha (or Society for the Knowledge of Truth), joined the two societies together, started a periodical called the *Patrician*, and prepared the 'Brahmic Covenant,' by which all members renounced idols, and engaged to worship the one God of the Vedanta, and to practise virtue. In 1847 there were 767 converts. Soon after, in spite of the resistance of the conservative party under Akhai Kumar Datta, the special infallibility of the Vedas was after study renounced; and the Brahma Dharma, published by Tagore in 1850, consisting of the Covenant and Four Articles of Faith (Bijam), appended to extracts from the later Hindu scriptures, and declared to be the basis of the society, is what any theist might adopt. Although converts continued to be made, and branch Somajes were started outside Calcutta, external conformity to Hindu sacraments was the rule among Brahmos; it was not till 1861 that Tagore himself discarded the sacred thread, and performed marriage without an idolatrous rite. But the true regeneration of the society came from Keshub Chunder Sen (born of the Vaidja or Physician caste, 19th November 1838), who having previously taught and written in its defence from 1859, was ordained a minister of the Somaj in 1862, and who immediately demanded the renunciation of the 'thread' by all ministers, and supported the intermarriage of castes. Tagore could not consent to this, and accordingly in 1865, Sen seceded with most of the younger members, and established the 'B. S. of India,' of which he became secretary. Progress and Bhakti (regenerating faith) is the motto of the Church, a spirit of earnest devotion distinguishing their Sankirtan (hymnal service), the Brahmotsab (or periodic festival), and the practice of singing in missionary bands through the Calcutta streets. The only fixed parts of the B. service are the Sanskrit Adoration Chant, Satyam jnanamantam Brahma, and the United Prayer, ending, Shanthi, Shanthi, Shanthi (peace). For lessons they use a compilation of theistic texts from Hindu, Jewish, Christian, Mahometan, and Parsee scriptures. By the aid of such men as Protab Chunder Mozoomdar, the theistic movement has been extended to all the Presidencies and the Punjab, there being now 95 Somajes in India (*Theistic Annual* for 1875), containing not more than 6000 members in all, recruited mainly from young men taught at the English colleges. Their views are expounded in the *Indian Mirror* and the *Dharma Tatva*; and the B. Mission Office, the B. School, and the Society of Theistic Friends,

all at Calcutta, show the zeal which Sen has infused into his followers. Since his visit to England in 1870, he has also started the Indian Association for Social and Moral Reformation of Natives, the most important work of which has been the foundation of the Normal School for female adults, and of the girls' school attached to it. Episcopalians and Presbyterians co-operate in this. The non-idolatrous marriages having been pronounced invalid, Sen led the movement which resulted in civil marriages, under restrictions as to age, being permitted under the Native Marriage Act of 19th March 1872. In the large towns the Brahmos have merely to encounter the social and domestic inconveniences implied in 'outcasting'; in the country districts violent acts of persecution have occurred. It may be added that the Adi, or original Somaj, under Tagore, still exists, and was strongly opposed to the Marriage Act; and that the 'Prarthana Somaj,' or Prayer Society of Bombay, is independent of the B. S. The characteristic of the later movement is intellectual eclecticism combined with a fervent piety and a practical philanthropy. A number of interesting publications may be got from Isbister & Co., London, or from the Society's office, 1 Mirzapore Street, Calcutta.

Brahms, Joh., a distinguished living pianist and composer, born at Hamburg, 7th May 1833, where his father was contrabassist at the theatre. On a professional journey in 1853 he met Schumann at Düsseldorf, became his enthusiastic admirer, and is now his greatest living follower. In 1863 B. became Director of the Sing-Akademie at Vienna, in which city he has since lived. His compositions are numerous in all departments except the dramatic, but they are more popular in N. than in S. Germany. B.'s greatest work is probably his *Ein Deutsches Requiem* by which also he is best known in this country.

Braïla, Bراهيم, or Ibrail, next to Galacz, the most important trading place of Roumania, and a free port of Wallachia, formerly a fort, situated on the left bank of the Danube, about 100 miles from its mouth, and where it is entered by the Sireth in six streams. It is 11 miles S. of Galacz, and 92 S.W. of Bucharest by railway (completed 1873), and has a large and growing export trade, chiefly in wheat, maize, barley, rye, colza, linseed, timber, petroleum, and flour. B. is the seat of a district presidency, and contains a quarantine hospital, several churches, and many handsome rectangular streets. In 1872-73, the increased traffic in the river had led to the construction of extensive new wharves and quays, while the town was being lighted with gas, and regularly supplied with purified water. No record of the trade is kept by the customs and port authorities. Pop. 25,767. In the last half of the 18th c., B. was repeatedly stormed and taken by the Russians, who finally destroyed it by fire in 1770. Restored to the Porte by the peace of 1774, it was once more occupied by the Russians in 1828, but finally reverted to Turkey on the Peace of Adrianople in 1829.

Brails, a nautical term, meaning small ropes for gathering up a yard to the bottom and skirts of its sail, preparatory to furling. The sail is 'brailed up' when the brails are hauled taut.

Brain is the name given to that part of the nervous system contained within the cranium or skull. The B., with the Spinal Marrow (q. v.), constitutes what anatomists have described as the *cerebro-spinal axis*. The B. (or *encephalon*) is covered with three membranes, called *dura mater*, *arachnoid*, and *pia mater*. 1. The *dura mater*, the most external, is a thick, fibrous membrane, and lines the interior of the skull. It adheres closely to the inner aspect of the bones of the skull, forming to them a kind of periosteum. The inner surface of this membrane is serous, and covered with epithelium. 2. The *arachnoid*, so named from two Greek words signifying *like a spider's web*, is a very thin, delicate, serous membrane. It envelops the B. without dipping into the fissures between the convolutions of the B. It lies between the *dura mater* and *pia mater*. Between it and the *pia mater* is the sub-arachnoid space containing serous fluid, the *cerebro-spinal fluid*. 3. The most internal membrane of the B. is called *pia mater*. This, like the *dura mater*, is a vascular membrane. It envelops closely the B., dipping deeply between the convolutions of the B. It has also lymphatics and nerves. After removing the membranes of the B., the B. proper is ex-

posed to view. This may be divided into four parts—*cerebrum*, *cerebellum*, *pons varolii*, and *medulla oblongata*.

1. **Cerebrum**.—This forms by far the largest portion of the human B., and occupies a large portion of the interior of the skull. It is constricted on its under surface, and at this constriction it passes into the *cerebellum* and *pons varolii*. The *cerebrum* forms the whole upper surface of the B., entirely concealing all the other portions. When looked at from above, the B. is seen to be divided throughout its entire length by a deep fissure running in a straight line from before backwards, called the *longitudinal fissure*. This fissure divides the *cerebrum* into equal parts, called the *hemispheres* of the B. Anteriorly and posteriorly it penetrates the whole depth of the B., but in the centre it is intercepted by a band of white tissue running across from right to left, called the *corpus callosum*, and uniting the two hemispheres of the B. That portion of the *dura mater* which dips into this fissure is called the *falx cerebri* from its resemblance to a sickle. Besides the longitudinal fissure dividing the B. into the *right* and *left* hemispheres, there are other well-marked fissures. Of these, the chief are—(1) Fissure of Sylvius, which runs transversely and separates the anterior from the middle lobes of the B. At the outer part of the hemisphere it divides into two branches, which enclose that portion of the B. called *island of Reil*. (2) Fissure of Rolando, also a transverse fissure, and of importance as being peculiar to the B. of man and of the higher monkeys. Besides these there are other named fissures; and between each convolution there is a fissure (or *sulcus*) running zigzag, and dipping more or less deeply into the substance of the B. Anatomists have usually divided each hemisphere of the B. into three lobes—*anterior*, comprehending that part in front of the fissure of Sylvius; the *posterior lobe*, that portion lying over the *cerebellum*; and the *middle lobe*, that part between the other two.

Brain—Upper.

Internal Structure of Cerebrum.—On slicing off portions of the B. to a level with the transverse fibres called *corpus callosum*, the white tissue of this structure is brought into view; and if we divide longitudinally this band of white fibres a little to each side of the middle line, we expose a cavity on each side called the *right* and *left ventricles*. These cavities are lined with a serous membrane, contain fluid, and in the disease known as *water in head*, true *Hydrocephalus* (q. v.), become enormously distended with fluid. The partition separating these two cavities is called *septum lucidum*. These ventricles have been divided into three parts, anterior, posterior, and middle, corresponding to the three lobes of the B.

Brain—Lower.

2. **Cerebellum, or Little B.**, is situated behind, and in man is entirely covered by the *cerebrum*. It is joined to the *cerebrum* by the *crura cerebri*, and to the *medulla oblongata* by the *inferior peduncles*, and to the *pons varolii* by the *middle peduncles*. It is about $3\frac{1}{2}$ or 4 inches in the transverse diameter, and about 2 inches from before backwards, and at its deepest portion not more than 2 inches. It consists of two hemispheres joined together in the middle. It is not, like the *cerebrum*, divided

into convolutions, but is composed of numerous laminae or plates.

3. *Pons Varolii* is that portion of the B. which unites the various parts together. It is connected with the cerebrum above, the cerebellum behind, and the medulla oblongata below. It consists of transverse and longitudinal layers of white matter, with grey matter interspersed.

4. *Medulla oblongata* is that portion of the B. which is continuous with the spinal chord below and with the pons varolii above. It has much of the structure of the chord. The space between the medulla oblongata and the cerebellum is called the *fourth ventricle*, which communicates with the *third ventricle* by the passage of Sylvius. The third ventricle is a narrow fissure between the optic thalami, and communicates by the foramen of Monro with the lateral ventricles.

Structure of the B.—Externally it is composed of grey matter, and internally of white matter. The grey substance is composed to a great extent of peculiarly shaped cells, having many processes radiating from them, whereas the white matter is composed of fibres or tubes which convey *influences* to and from the grey matter. The grey matter extends into the bottom of all the convolutions, and is found in masses of various shapes and sizes in the interior and under surface of the B., called *ganglia*. These ganglia will be described under separate heads.

For chemical composition of the B., see NERVE TISSUE.

Many of the most important structures connected with B. are situated on its under surface, and will be fully described under their respective names.

Development of B.—In early foetal life the B. is not distinguishable from the spinal cord, but after a time the end gradually expands and develops into the various structures composing it. At birth the convolutions are not formed, but are developed afterwards and gradually. As these develop, intelligence is manifested. There is a marked degree of relation between the intellect and the number and complexity of the convolutions of the B. In certain distinguished men this has been most marked. There is a certain proportion between the weight of the B. and the intellect of the individual. Great men have generally the largest amount of B., and idiots have frequently very light B. The B. of males is heavier than that of females. The average weight of B. in an adult male is about 48 oz., and in females 43 oz. At birth in the male it is nearly 14 oz., and in the female a little above 12 oz. The B. of the distinguished naturalist Cuvier is said to have weighed more than 64 oz. The B. of man is heavier than that of all animals except the B. of the whale and elephant. The B. of the elephant is said to weigh about 9 lbs., that of the whale about 5 lbs.

For a description of the B. of different classes of animals, see under the various classes.

Diseases of the B. will be treated under their respective names, as APOPLEXY, INFLAMMATION OF B., HYDROCEPHALUS, &c.

Brain Coral (*Meandrina*), a genus of *Sclerodermic* corals, so named from the surface of the coral structure presenting windings resembling the convolutions of the human brain. The surface is hollowed out into sinuous, shallow, elongated cells, which combine to form a massive polypidom or compound mass. These corals are chiefly found in the Indian and S. Atlantic Oceans, and sometimes attain a diameter in masses of 8 or 9 feet. *Meandrina cerebriformis* is a familiar species, and aids in the formation of coral reefs.

Braine-le-Comte, an ancient town of Belgium, province of Hainault, on the Brainette, 18 miles S.S.W. of Brussels by railway. It has active cotton manufactures, brewing, dyeing, &c., and produces some of the finest flax and lace-thread in the world. Pop. (1873) 6464. In 1158 Count Baldwin bought B. from the monks of St Wandru at Mons, to whom it had belonged formerly.

Brain-tree, an old market-town, county Essex, 38 miles N.E. of London, and 18 W. of Colchester by railway, with manufactures of silk, straw-plait, and crape. Pop. of parish (1871) 4790.

Brake, or **Bracken**, a name generally applied to the common fern, *Pteris aquilina*, which is widely spread over the world. The specific name *aquilina* is given to it because in cutting across the underground stem (rhizome or root-stock) it appears

something like a spread eagle (Lat. *aquila*). The root-stock is bitter, but contains considerable nutriment. It is eaten by the Vancouver Island Indians; and in times of scarcity, in some districts of Europe, has been made into a kind of wretched bread. It is astringent and anthelmintic. The ashes are employed in making soap and glass, and the fronds for littering cattle, and even, when mixed with straw, for feeding them. It is difficult to extirpate; but the best method of doing this is to repeatedly mow it as soon as it appears, when the vitality of the plant is destroyed. There are many other species, most of which, both in their good and bad qualities, do not differ widely from the familiar British B.

Brake, an apparatus by which the energy of a moving body may be absorbed by friction, in order either to stop or retard its motion, as in the B. upon a train, or to use up surplus energy, as in the testing of engines 'on a B.'

Bra'ma (Cuvier), a genus of Teleostean fishes of the family *Chatodontida*, possessing much-compressed, high bodies, with the dorsal and anal fins scaly. The profile is deep and abrupt, and slender, curved teeth exist in the jaws and palate. The caudal or tail fin is very high, narrow, and crescentic. The common species (*Brama Raiti*), or Ray's bream, sometimes found on British coasts, and common in the Mediterranean Sea, is also known by the name of 'sea-bream.' Another species is the *B. pinnaquamata*. The flesh is very palatable.

Bra'mah, Joseph, a distinguished mechanical inventor; the son of a farmer, was born at Stainborough, Yorkshire, 13th April 1749. After establishing himself in London, he patented numerous ingenious inventions, of which his improvements in fire and steam engines, in paper-making, and in wheel-carriages, locks, &c., merit notice. The *B. press* (see HYDROSTATIC PRESS) was constructed about 1800. B. died December 9, 1814. See Dr Brown's sketch of B.'s life in the *New Monthly Magazine*, April 1844.

Braman'te, Donato Lazzari, a famous Italian architect and painter, was born at Monte-Asdroaldo, Urbino, in 1444. In Milan he studied carefully the construction of the famous cathedral, and in Rome the numerous monuments of antiquity there. He was successively employed by Sforza and the Popes Alexander VI. and Julius II. He revived the taste for the ancient architecture—his masterpiece in this department being the small church of San Pietro in Montorio. Among his other works are the palaces Giraud (now Torlonia) and Sora, and the immense galleries which unite the two pavilions of the Belvedere to the Vatican. He died at Rome in 1514. B. figures in the 'School of Athens' of Raphael, for whom he had procured the patronage of Pope Julius II. His pictures, both in fresco and oil, are numerous in Lombardy, and are highly esteemed. He has also written some poetry, which was published in 1753. See Quatremère de Quincy's *Vies des Architectes Célèbres*.

Brambanan', a district of Soorakarta, in Java, notable as containing not fewer than 296 Brahminical temples, more or less entire. The largest of these temples is an imposing structure, richly ornamented with mythological figures.

Bram'ble (*Rubus fruticosus*), a common British plant belonging to the order *Rosacea* (q. v.). It is rarely cultivated, but is abundant in a wild state. Its fruit is gathered for the manufacture of a 'wine' much esteemed among connoisseurs in such homely taps. There are many species of *Rubus*, but the genus is so variable that no two botanists are agreed as to what are species or what only varieties. Many species are met with in Asia and N. America. *R. nultkanus* (the 'thimble-berry') and *R. spectabilis* ('salmon-berry'), from N.W. America, have fruits which supply a large portion of the food of the Indians, who dry them also for winter use. They are cultivated for their flowers in this country.

Bram'ble, or **Mountain Finch** (*Fringilla montifringilla*), an *Insectorial* bird, belonging to the *Fringillida* or finch family, found in Britain in winter only, and as a mere visitant distributed widely over Europe and Asia. In winter it occurs also in Italy, Malta, Smyrna, &c. The B. breeds in Scandinavia. It averages an ordinary chaffinch in size. The males are coloured brown, interspersed with black on the upper parts in winter,

and black in spring and summer; the throat and breast during the latter season being fawn coloured, whilst the wings are banded with a white and black stripe. The tail-feathers are black, with reddish-white margins, and the tail itself is forked. The song is a mere chirp.

Bran, the husk or outer covering of the grain of wheat. It is separated in grinding in thin sharp scales of a brown colour, and contains a large proportion of indigestible woody fibre. It, however, possesses a high percentage of nitrogenous matter in the form of cerealin and of salts. B. is chiefly used for the feeding of horses and pigs, and in medicine it is a useful medium for applying heat externally. B. taken internally has a tendency to cause diarrhoea, by mechanically irritating the intestinal coats.

Branch is, in botany, applied to any subdivision of a stem which does not arise directly from the root. Branches originate in leaf buds at *Nodes* (q. v.), and are given off at various angles from the stem, giving rise to the different contours of shrubs and trees. M'Cosh and Dickie believe that the angle at which the branches are given off from the stem, as well as the general ramification, agrees in many cases with the angle at which the veins are given off from the mid-rib, and with the general venation in the leaves of the same tree. The *runner* in the strawberry plant is a B. which runs along the ground, and sends out roots from its under surface, producing new plants; while the tubers of the potato plant—the ordinary edible 'potato'—is not a root, but a shortened underground stem, in the cellular substance of which starch has accumulated.

Branchiæ, the scientific name applied to the gills of animals. See GILLS. The presence of these structures is associated with an aquatic existence, and they form valuable guides in the classification of animal forms.

Branchial Arches, the name applied to the bony arches of fishes, which exist on each side of the throat, and are attached superiorly to the under surface of the skull. They support the gills or *Branchiæ*, and each arch is composed of two distinct pieces, known as the *cerato-branchial* and *epi-branchial* bones. The B. A. grow successively smaller as they recede from the mouth, and in many fishes may support teeth.

Branchial Heart, the name applied to the heart in fishes, for the reason that its sole function consists in driving the venous or impure blood to the *branchiæ* or gills for purification. This name is used in contradistinction to the same *systemic heart*, which (as in *Gasteropodous Mollusca*) drives the *pure* blood through the system. In *Cephalopoda* (q. v.), or cuttlefishes, a B. II. exists at the base of each gill in addition to the systemic heart; and by means of these branchial hearts the venous blood is propelled to the gills to be aerated.

Branchial Sac, the term applied to the breathing chamber of the *Tunicate* (q. v.), molluscs or 'sea-squirts,' which consists of a sac, the walls of which are composed of a network of blood-vessels, in which the venous blood is exposed to the oxygen contained in the water admitted to the sac.

The name is also applied to the pharyngeal dilatation or sac seen in the *Amphioxus* or *Lancelet* (q. v.)—the lowest member of the fish-class—and which is also used for respiration.

Branchiata, the name given to various groups of animals from the fact of their possessing *branchiæ* or *Gills* (q. v.). Thus the *fishes* and *amphibians* (as frogs, &c.) together form the *Branchiate Vertebrata* from the fact that they possess gills at some period of life—the fishes during the whole of life, and the *amphibia* always in *early* life; the breathing, in the latter case, being afterwards carried on partly or entirely by lungs. The *Branchiate Gasteropodous mollusca* include the *whelks*, &c., which breathe by gills, as distinguished from the snails or land *gasteropods*, which respire by means of pulmonary or lung-sacs. The name *Abranchiate* is used in opposition to the foregoing term.

Branchiopoda, a section of *Crustacea* (q. v.), including the orders *Cladocera* (water-fleas, &c.), *Phyllopoda* (fairy-shrimps, brine-shrimps, &c.), and probably also the extinct *Trilobites*. These crustaceans possess numerous *branchiæ* or gills attached to the legs, and hence the name of the section, which literally

means 'gill-footed.' In some cases the legs themselves constitute the breathing-organs. The body may be unprotected, or wholly or partially enclosed within a *carapace*; and the mouth is furnished with masticatory organs.

Bran'coo, Rio, a river of Brazil, the largest affluent of the Rio Negro, rises in the Parime Mountains, near the sources of the Orinoco, and flows S.S.W. for a distance of about 700 miles. When it joins the Rio Negro it is a mile broad, but rapids and waterfalls render it scarcely navigable.

Bran'cursus. See ACANTHUS.

Brand (Ger. *brennen*, to burn), the German name for the disease known in Britain as bunt, or pepper B., but also applied to Blight, Mildew, Rust, and Smut (q. v.).

Brandenburg, a central province of Prussia, with an area of 15,565 sq. miles, and a pop. (1871) of 2,863,229, of whom 42,722 are Wends. It arose mainly out of the old *Mark of B.* (i.e., the *Kurmark*, or Mark of the Elector), which consisted of the *Altmark* and the *Neumark*, but it has ceased to correspond exactly to the old territorial boundaries. It is divided into the three districts Berlin, Potsdam, and Frankfurt, and the city of Berlin is its capital. The country is everywhere flat and sandy, being in parts, however, extremely fertile, and is watered by the rivers Elbe, Havel, Spree, Oder, Warthe, and Netze. There are numerous lakes, of which the principal are the Schwieler, Scharmüzzel, Ucker, Plauer, Ruppiner, and Fahrland See, and the water system is further augmented by the Finow, Friedrich Wilhelm, Ruppiner, and Templiner Canals. Chief among the articles of product are barley, rye, maize, potatoes, and buckwheat, and the most important manufactures are woollen and cotton cloths, linen, shawls, tapestry, machinery, glass, chemicals, chocolate, and tobacco. B. has good pasturage, and produces the celebrated Berlin wool (*Electoral-Wolle*), held to be the best in the world. The only minerals are rock-salt and gypsum, found near Sperenberg. B. is traversed by the Elbe and Hamburg Railway, which has a length in the province (1872) of 700 miles. The population is composed of 2,720,242 Protestants, 86,047 Catholics, 47,484 Jews, and 5541 members of small Christian sects. The province has one university and eighteen gymnasia.

About the beginning of the Christian era the land now known as B. was occupied by the Semnones and the Longobards, next by the wandering Slavic tribes of the Hevellern, Wilzen, Redarier, and Obotrites; was subdued by Karl the Great in 789, and afresh by Heinrich I. in 928. In 931 it was made the *Nordmark* of N. Saxony (now *Altmark*), while the *Ostmark* (Niederlausitz) was founded by Gero, who died in 963. The Nordmark became the possession of the Princes of Stade in 1056, and was granted by the Kaiser, Lothar II., to Albrecht the Bear (q. v.), of the house of Ascania. In 1143 Albrecht also received the *Ostmark* as a fief of the empire, and henceforth named himself *Markgraf von B.* He next added to his dominion the *Mittelmark*, *Priegnitz* and *Uckermark*, wrested from his neighbours the Wends, who were all but extirpated by his merciless raids; the conquered territory being afterwards colonised by Rhenish, Dutch, and Flemish settlers. Albrecht was followed in succession by Otto I. in 1170, Otto II. in 1184, Albrecht II., founder of Berlin, in 1206, and Johann II. and Otto III., who reigned together 1226-58. In 1258 B. was divided between Johann I., head of the old B. Ascanian line of Stendal, and Otto III., founder of the younger line of Salzwedel. The former line expired in 1320, and the latter in 1317. A period of disorder followed, during which the Emperor Ludwig IV. (1324) placed over the Markgratdom his son Ludwig, who was succeeded by his brother Ludwig der Römer (1352), and in turn by Otto VII., the Lazy, who in 1363 entered into a treaty with the Emperor Karl IV., by which the Kurmark reverted to the house of Luxemburg. But Sigismund, son of Karl IV., sold Neumark to the German Order (1402), and mortgaged the land of B. (1411) to Friedrich VI. of Hohenzollern for £20,000. In

Branchiopoda.

1415 the territory was united to Nürnberg, the new ruler assuming the title of Friedrich I., Elector of B. Its further history is merged in that of Prussia (q. v.). See Küster, *Bibliotheca Historica Brandenburgensis* (Bresl. 1743), Riedel, *Codex Diplomaticus Brandenburgensis* (Berl. 1839-62), and Voigt, *Geschichte des Brandenb.-Preuss. Staats* (Berl. 1860).

Brandenburg (Wend. *Brennaborch* or *Brennibor*), the ancient town from which the province receives its name, formerly the capital of the Heveller, a Slavic race, and later of the Uckermark, is situated on the Havel, 37 miles W.S.W. of Berlin by railway. It is divided into three parts by the Havel—the old and new town on the opposite banks, and the *Dom* of B. on an island in the river. It is still the seat of the district courts, and has many high-class schools and charitable institutions. In the vicinity of the old town rises the Marienberg, some 200 feet high, on the summit of which once stood a heathen temple, which latter gave place to the famous Marienkirche, destroyed in 1772. The principal buildings are the cathedral (built 1170, restored 1836) and the citadel, both on the island, and St Katherine's Church (1401) in the new town. There are many beautiful promenades. B. has manufactures of woollens, silks, gold-lace, oil, and leather, and also some trade and fisheries in the Havel and the adjoining Beetz and Plauer Lakes. Pop. (1873) 25,822, including a garrison of 1013. B. was inhabited by the Wends as early as 927, became the seat of a bishop under Otto I. in 949, and the administration of its cathedral was secularised in 1598. See Heffter's *Geschichte der Kur- und Hauptstadt B.* (Potsd. 1839), and his *Wegweiser durch B. und seine Alterthümer* (Brandenb. 1850).

Brandenburg, New, next to Neustrelitz the most important town in the Grand-duchy of Mecklenburg-Strelitz, on the Tollen Lake, and on the Hamburg-Stettin Railway, about 60 miles W.N.W. of Stettin. It was formerly a strong town, and has still four beautiful old Gothic gates. Its finest buildings are the ducal palace, the restored Gothic Marienkirche, a theatre, and the Belvedere, a summer palace on the lake. The chief manufactures are woollens, damasks, tobacco, paper, beer, and brandy. There is an important wool and cattle market here. Pop. (1873) 7245.

Branding was formerly a punishment in England for various offences. At one time, it was awarded to all criminals found entitled to Benefit of Clergy (q. v.). Now, however, B. is confined to deserters from the army, the provision of the Mutiny Act being that 'on the first and on every subsequent conviction for desertion, the court-martial, in addition to any other punishment, may order the offender to be marked on the left side, two inches below the arm-pit, with the letter D; such letter to be not less than one inch long, and to be marked upon the skin with some ink or gunpowder, or other preparation, so as to be visible and conspicuous, and not liable to be obliterated.' The position for the mark seems hardly to be chosen with the view of its being 'visible and conspicuous.'

Brandis, Christian August, a German philosopher, son of an eminent physician, was born at Hildesheim, 13th February 1790. In 1816 he removed from Copenhagen, where he had been lecturing on philosophy, to Berlin; and there, in 1823, he published the *Metaphysics* of Aristotle, followed in 1836 by *Scholæ in Aristotelem*, and in 1837 by *Scholæ Græcæ in Aristotelis Metaphysicam*. His *Mittheilungen über Griechenland* (Leips. 1842) was written in Greece, where he was a member of King Otto's Council. His *Handbuch der Geschichte der Griechisch-Römisch. Philosophie* (Berl. 1835-60) is an invaluable contribution to the history of philosophy. B.'s latest work was his *Geschichte der Entwicklungen der Griech. Philosophie* (2 vols. Berl. 1862-64). He died 24th July 1867.

Branding. See PARR and SALMON.

Brandon (Welsh, 'the brow of the hill'), a market-town on both the Suffolk and Norfolk side of the Little Ouse, 78 miles N.N.E. of London, and 30 N.W. of Cambridge by railway. It has several charitable and educational endowments, and some trade in corn, malt, and timber. Pop. (1871) 2116.

Brandt, Sebastian, author of the *Narrenschiff* ('Ship of Fools,' Lat. *Stultifera Navis Mortalium*), was born at Strasburg

in 1458, became a Professor of Law at Basel, and afterwards Syndic of his native town, where he died in 1521. B.'s chief work is a satiric poem, written in German, and afterwards translated into Latin. It was read all over Europe, and was famous for more than two centuries; yet it has not much poetic force or liveliness. There is no fine invention or brilliant imagery; but the moral reflections are weighty and sensible. It formed the model of Barclay's well-known *Ship of Fools*. The work is now very rare. After the German edition of Basel, and the Latin of Lyon, the date of neither of which is known, the oldest is that of Strassburg (1491; new ed. by Zarncke, Leip. 1857).

Brandy (Fr. *eau de vie*; Ger. *branntwein*) is the spirit for drinking distilled from wine, which owes its peculiar flavour to the presence of minute quantities of ceanthnic, acetic, butyric, and valerianic ethers. It also contains a little tannin, extracted from the casks in which it is stored, to which it owes its pale yellowish colour, and when it is deep brown it has been so coloured by caramel or burnt sugar. The specific gravity of B. should be from '929 to '934; it should contain from 50 to 60 per cent. of alcohol, 1·2 of solids, about 1 grain of acid in every ounce, and it should be free from sugar. The best brandies are those manufactured in Cognac, in France, but they are distilled in most wine-producing countries, and experts can recognise the produce of different localities by the peculiar aroma of each. Large quantities of factitious B. are prepared in Great Britain from grain spirit, which is flavoured to imitate cognac by the addition of Hungarian oil or ceanthnic ether, and a much more deleterious spirit is prepared abroad from potato-spirit, which is freely passed as B. As potato-spirit contains a large proportion of fusel oil, its effects are very hurtful to those who drink this spurious B. The quantity of B. imported into Great Britain in 1873 was 6,483,486 gallons, on which a duty of £2,375,447 was paid. Of this quantity no less than 6,378,398 gallons were imported from the Cognac district.

Brandywine Creek, a N. American stream, 36 miles long, rising in Pennsylvania, and flowing through Delaware to Christina Creek, with which it joins the Delaware river, immediately below Wilmington. It has a place in history as the scene of an adva. gained by the British during the War of Independence in September 1777.

Brank, an instrument formerly used in England and in Scotland for the 'taming of the shrew.' In England, it was called 'the scold's bridle.' It was a kind of iron mask, which covered the head and face, with apertures for the nostrils and eyes. At the mouth, a plate of iron projected inwards, so as to press upon the tongue of the culprit, who was thus effectually gagged. In a work called *England's Grievance Discovered in Relation to the Coal Trade*, published in 1655, and dedicated to Oliver Cromwell, there occurs the following description of punishment by B. :—'John Willis, of Ipswich, upon his oath, said that he was in Newcastle six months ago, and there he saw one Anne Bidlestone drove through the streets by an officer of the same corporation, holding a rope in his hand, the other end fastened to an engine called the B., which is like a crown, it being of iron, which was muzzled over the head and face, with a great gap, a tongue of iron forced into her mouth, which forced the blood out; and that is the punishment which the magistrates do inflict upon chiding and scolding women, and that he hath oft seen the like done to others.' In a B. preserved in the County Hall of Forfar, called 'the witches' bridle of Forfar,' dated 1661, the gag is a long piece of iron, with three sharp spikes. A B. may be seen in the Ashmolean Museum at Oxford, and in the National Antiquarian Museum of Edinburgh, and in several other places in England and Scotland.

Brantôme, Pierre de Bourdailles, Seigneur de, a French historian, born at Périgord about 1540. He was chamberlain to Charles IX. and Henry III., studied war under François de Guise, and fought against the Huguenots and Turks. He died 15th July 1614. B.'s principal works are his *Mémoires*, his *Vies des Hommes illustres et grands Capitaines Français*, his *Vies des grands Capitaines Étrangers*, his *Vies des Dames illustres*, and his *Vies des Dames galantes*. The *Œuvres de B.* were published at the Hague, in 15 vols., in 1740; and republished at Paris, in 8 vols., in 1787. They furnish lively pictures of the

times, and the author's complacency is amusing. He predicted their well-merited success.

Bras'dor's Operation is a cure for Aneurism (q. v.), and consists in applying a ligature to the artery on which the aneurism is situated, not on the cardiac side of the aneurism, but on the distal side, or that side which is farther from the heart than the tumour. Obstruction occurs at the point tied, and coagulation of the blood in the artery takes place back to the point where the next branch is given off, and so favours the cure of the aneurism. B. O. is only to be performed when the vessel cannot be safely tied on the side of the aneurism next the heart. When a large branch of an artery is given off between the aneurism and the point tied, B. O. will fail to effect a cure.

Brasenose, an Oxford college, otherwise named King's Hall, founded in 1509 by William Smith, Bishop of Lincoln, and Sir Richard Sutton, Prestbury, Cheshire, for a principal and twelve fellows. The number of fellowships was afterwards increased to twenty. The name is said to have grown out of 'Brewing-house,' but probably arose from the college having been partly built of the ruins of the hostel of B. Hall, and a brazen nose actually projects over the gateway. There are seventeen Hulme exhibitions, the present worth of each of which is £135, with an allowance of £20 for books. The senior fellowships had become of great value, but the commissioners under 17 and 18 Vict., c. 81, limited their value to £300 per annum, raising the junior fellowships from £80 to £150. The suppression of five of the fellowships left funds free for the endowment of a professor and for some additional scholarships. The college has the presentation to twenty-three livings, and the trustees of the Hulme exhibitions have twenty-nine pieces of preferment in their gift. The fellowships, which were formerly confined to the natives of certain counties, are now open. The number of names on the books in 1874 was 508, and the number of undergraduates 112.

Brash, Water. See PYROSIS.

Bras'idas, a distinguished Spartan general, who was appointed *Ephor Eponymus* for having relieved Methone when besieged by the Athenians at the beginning of the Peloponnesian War (B.C. 431). In 424 he relieved Megara, and in 422, with greatly inferior forces, defeated the Athenians under Cleon, both generals being killed in the action. The allied troops were present under arms at his burial within the walls of Amphipolis, and his memory was long preserved by yearly sacrifices at his tomb, and by the institution of games in his honour. He was a mixed character, undoubted heroic qualities co-existing with equally undoubted duplicity, a quality which gave him unusual dexterity and tact as a negotiator.

Brass is an alloy of copper and zinc, but frequently contains small quantities of iron, tin, or lead. B. was formerly manufactured by heating a mixture of calamine (carbonate of zinc), charcoal, and copper to a temperature rather less than that required to melt copper, when the charcoal reduced the calamine, and the zinc, as fast as it was formed, became alloyed with the copper. B. is now made by directly alloying the two metals. The copper is first melted, the proper proportion of zinc then added, and the resulting metal cast into ingots. The colour and properties of B. vary with the proportions of its constituents. Thus, by fusing 53.49 parts of zinc with 46.51 of copper, a brittle crystalline alloy is obtained of a *silver white* colour, whereas ordinary B., which contains about 64 per cent. of copper, is ductile, malleable, and of a golden colour. The addition of a small quantity of lead greatly increases the hardness of B., and prevents it from clogging the file, and for the same reason renders it suitable for being turned on the lathe. A small proportion of tin also hardens B., and is added to B. which is to be engraved. The specific gravity of B. (8.3) is greater than the mean of the specific gravities of its two constituents; in other words, contraction takes place when copper is alloyed with zinc, and this contraction is accompanied by a rise of temperature. Both these facts would indicate that B. is really a chemical compound, or at least contains a chemical compound of the two metals of which it is formed, and this supposition is strengthened by the fact that B. can be deposited by galvanic action. See ELECTROLYSIS.

Muntz metal contains from 60 to 70 per cent. of copper, and from 40 to 50 per cent. of zinc. It can be rolled into plates whilst hot, and is used as a sheathing for ships.

Aich or Gedge's metal contains 60 per cent. of copper, 38.2 of zinc, and 1.8 of iron. It can be forged, cast, and rolled, and is also well adapted as a sheathing for ships.

Sterro metal (Gr. *sterros*, firm) is a very hard alloy, containing 55 per cent. of copper, 42.4 of zinc, 0.8 of tin, and 1.8 of iron.

Hard solder is made by fusing together two parts of B. and one of zinc. When B. is strongly heated, the zinc which it contains volatilises—indeed, it is not possible even to fuse it without loss of zinc occurring.

Brass'arts, uniting the shoulder and elbow pieces of the plate-armour worn in former ages, protected the upper part of the arms. Demi-B. shielded only the front of the arms. *Brachiale* was the ancient name for B.

Brasses, Monumental, slabs or plates of brass, or of a mixed metal called *latten*, or *Cologne plate*, inlaid in tombstones

Monumental Slab in Bruges Cathedral.

usually placed on the floors of churches. The effigies of the deceased persons, or appropriate symbols, are incised in outline upon these plates, and the incisions filled up with bitumen or other black substance: in the very early B. enamelled work also occurs. In England about 4000 B. are preserved, a much larger number than exists in any other country in Europe, owing, probably, to their almost total destruction on the Continent during the many revolutionary changes which have occurred there; in England, too, the number of B. has been greatly lessened by the vandalism that accompanied the Reformation and the civil wars of the 17th c. Their use was introduced into England from Flanders early in the 13th c., but the oldest example extant is in Rochester Cathedral, on the tomb of Walter de Merton, who died in 1277. The eastern counties of England, from Kent to Norfolk, with the adjoining counties of Surrey, Sussex, Middlesex, and Berks, furnish by far the larger portion; a few are preserved in cathedral and conventual churches in the W. of England; in the other parts of the United Kingdom examples are extremely scarce. Old B. are remarkable for their chaste and beautiful designs, often expressed in a few simple lines; and where effigies are depicted, valuable sources of information to the artist are provided regarding the varied costumes worn by different ranks of society

during a period of nearly four centuries. The use of B. in England appears to have declined about the time of Charles I., but the fashion has been revived of late years. An estimate may be formed of the kind of metal employed for B. from the analysis of a Flemish specimen, which yielded in 100 parts, 64 of copper, 29.5 of zinc, 3.5 of lead, and 3 of tin. See Cotman's *Engravings of the Sepulchral B. in Norfolk and Suffolk* (new ed. 2 vols. Lond. 1874), and Haines' *Manual of M. B.* (2 vols. Lond. 1873).

Brassica, a genus of plants belonging to the natural order *Crucifera* (q. v.), to which many cultivated plants, such as Cabbage (q. v.) and its varieties (kale, borecole, colewort, greens, cauliflower, broccoli, Brussels sprouts, and kohlrabi), Turnip (q. v.), Navel (q. v.), &c., belong. The Isle of Man cabbage is *B. Monensis*. It grows wild on sandy soils, and is eagerly eaten by sheep and cattle.

Braun, August Emil, a distinguished German archæologist, was born at Gotha, 19th April 1809. In 1833 he went to Rome, where he became first librarian, then secretary, to the Archaeological Institute, and where he died, September 25, 1856. Of his numerous works may be mentioned *Il Giudizio di Paride* (Par. 1838); *Griechische Mythologie* (Hamb. and Gotha, 1850); *Griechische Götterlehre* (Gotha, 1851-55); and *Die Ruinen und Museen Roms* (Bruna, 1855).

Braunsberg, a walled town of Prussia, province of E. Prussia, on the Passarge, 40 miles S.W. of Königsberg by railway, has an old castle built in 1241, a Catholic college constituted in 1818, and several hospitals. It has an active trade, and is specially famed for its *Pillwurst* beer. Pop. (1871) 10,471, of whom three-fourths are Roman Catholics.

Brauer or Brouwer, Adrian, a Flemish painter, born in 1608 at Haarlem, according to others at Oudenarde. His parents were poor, and gave him no education, but Nature had made him an artist, and from an early age he painted birds and flowers, which his mother sold to country-folks. Later on he became a pupil of Franz Hals, who possessed himself of B.'s pictures and sold them for his own benefit. B. effected his escape from his rapacious master, and at Amsterdam sold his works for large sums, which he squandered in low dissipation. He was generously befriended by Rubens, who highly admired his talents; and after B.'s death in the hospital of Antwerp in 1640, Rubens had his body disinterred from among the graves of the poor, and honourably buried in the Church of the Carmelites. The subjects of his pictures are taken from taverns and their inmates, and are put on the canvas with great truth and energy.

Bravi, an Italian term, the plural of *Bravo*, applied to persons who for hire undertook to assassinate and murder, though originally confined to persons indiscreetly daring.

Bra'vo, or **Rio Grande del Norte**, after the Mississippi the largest river which flows into the Gulf of Mexico, rises among the Rocky Mountains in Colorado, U.S., and has a course, generally south-easterly, of 1800 miles, serving through two-thirds of its length as a natural boundary between Texas and Mexico. It receives the large river Pecos from Texas, and the Salado and Conchos from Mexico. Owing to its shallowness, and the frequent occurrence of rapids and sandbars, it is of little use commercially.

Bravura (Ital.), a musical term applied both to a composition and to a style of performance. A B. composition is one consisting mainly of florid and intricate passages, runs, ornaments, &c. Even when written by a great musician, it possesses little interest except as a means of displaying the talents of a great singer.

Brawling in Church is by the law of England an offence against public peace. The Act 23 and 24 Vict., c. 32, abolishes the jurisdiction of ecclesiastical courts in England and Ireland in suits against any person not in holy orders for defamation and B. By the same Act, any person guilty of riotous or indecent behaviour in any church in England or Ireland, or in any churchyard, burial-ground, chapel, or place of religious worship duly certified, or who shall molest any preacher or minister authorised to preach therein, shall, on conviction before any two justices, be liable to a penalty not above £5 for every offence, or,

in default of payment, to two months' imprisonment. Offenders may be immediately apprehended after the offence by constable or churchwarden. Persons aggrieved may appeal to next quarter-sessions. To obstruct or assault a clergyman or other minister in the discharge of his duties is a misdemeanour, and any person convicted is liable to be imprisoned for any term not exceeding two years, with or without hard labour. See CHURCHYARD.

Brawn (Old Fr. *brâion*, 'a roll of flesh'), the designation of a male pig after it is weaned. A cut or castrated pig is called a *brauner*. The name B. is also applied to the flesh of swine freed from all bones, formed into a roll, seasoned with spices, and boiled: Wiltshire B. is much relished, and is particularly palatable in sandwiches.

Braxy, a fatal blood disease in sheep, produced chiefly from indigestion, inducing constipation, setting up acute inflammation in the bowels, whose ultimate and speedy result is death. The indigestion, according to the author of *The Book of the Farm*, is occasioned by a sudden change of food from succulent to dry; and on hill farms this is more easily discernible, on account of the snow in winter covering the grass upon which the stock had been feeding, necessitating their subsistence upon the tops of old heather and other plants growing on high altitudes. Mr Stephens recommends that the sheep should be provided with shelter, and turnips and hay given to them. The Ettrick Shepherd, James Hogg, in his *Sheep Guide*, says the loss of cud is the first indication of B. When the sheep stands, it brings its four feet into the compass of a foot, is restless, lying down and rising up in the space of a few minutes; the eyes are dull and heavy, the ears down-hanging, the tongue and mouth parched, and the belly distended to bursting. Hogs affected with B. frequently die between night and morning. In some parts of Scotland, the flesh of sheep suffering from B. is cured and hung up in the shielings, and is much relished as an article of diet. See Stephens' *Book of the Farm*, Clater's *Cattle Doctor*, Cowan's essay in *Transactions of the Highland and Agricultural Society*, 1863, Dick's *Manual of Veterinary Science*, and Williams' *Principles and Practice of Veterinary Medicine*.

Bray, a rapidly-rising watering-place on the E. coast of Ireland, just on the border line between the counties of Dublin and Wicklow, 13 miles S.E. of Dublin by railway. It may be said to have sprung into existence only of late years, but is already a flourishing town of fine villas, with many hotels and a large Turkish bath. Pop. (1871) 6087, being an increase of almost 50 per cent. over that of 1861.

Bray, Mrs Anna Eliza, an authoress of considerable repute and with keen artistic sympathies, was the daughter of the late Mr John Kempe, a gentleman of Cornish extraction, and was born in the end of last century. She has been twice married, first to Mr Charles Alfred Stothard, an artist, who was killed, May 1821, by a fall from a ladder, and secondly to the Rev. E. A. B., vicar of Tavistock. She has published memoirs of both, a variety of works on art and music, and a large number of historical romances, beginning with *De Foix* (1826), and ending with *Joan of Arc* (1874).

Bray, Edward Atkyns, B.D., F.S.A., husband of the preceding, was a poet and theological litterateur, and was born at Tavistock, Devonshire, 18th December 1788. He studied at Cambridge, and was called to the bar in 1806. But law not proving congenial, he took orders, and obtained the vicarage of Tavistock, where, after an industrious literary career, he died, 17th July 1857. B. wrote *Arcadian Idylls*, *Lyric Hymns*, *Discourses on Protestantism*, and published a variety of selections from eminent divines. His *Poetical Remains*, *Social, Sacred, and Miscellaneous*, with a memoir, were edited by his widow (2 vols. Lond. 1859).

Brayera. See CUSO.

Brazil (Fr. *Brésil*, named from the colour of its dye-woods; Port. *brasa*, 'a live coal'), an empire, and the largest and most populous state of S. America, comprehending one-fifteenth of the terrestrial surface of the globe, and extending between lat. 4° 30' N. and 33° S., and between long. 35° and 70° W. Its greatest length from N. to S. is 2600 miles; greatest breadth from E. to W., 2500; while it has a coast-line of 3600 miles. The areas,

divisions, and populations, according to the *Almanach de Gotha* for 1876, were as follows:—

Provincia.	Area.	Populations.	Slaves.
Amazonas	753,470	57,610	979
Pará	412,464	859,821	27,199
Maranhão	141,651	359,040	74,939
Piauí	81,779	202,222	23,795
Ceará	50,262	721,686	31,913
Rio Grande do Norte	80,130	233,979	13,020
Parahyba	80,346	362,557	20,914
Pernambouc	46,257	841,539	89,028
Alagoas	11,642	348,009	35,741
Sergipe	12,035	161,307	21,495
Bahia	204,802	1,283,141	168,295
Espirito Santo	17,030	82,137	22,659
Rio de Janeiro	18,490	727,576	270,726
Município Neutro		274,972	48,939
S. Paulo	90,541	837,354	156,612
Paraná	108,557	126,722	10,560
Santa Catharina	18,924	159,802	14,984
Rio Grande do Sul	110,215	430,878	66,876
Minas Geraes	237,482	2,009,023	366,574
Goyaz	263,335	100,395	10,652
Matto Grosso	668,653	60,417	6,667
Total	3,298,065	9,700,187	1,476,567

The population is composed of Portuguese, Creoles, English, Germans, Swiss, Chinese, and aborigines.

Physical Aspect, &c.—B. is mountainous over about one-third of its surface. There are vast plains in the N. and S., and the interior rises into extensive plateaux. The three great mountain chains are (1) *Serra do Mar*, on the E. coast, with peaks from 4000 to 5000 feet high; (2) the *Serra do Espinhaço*, the middle range, forms the E. border of the Diamond plateau (*Minas Geraes*), and has peaks of over 7000 feet; and (3) the *Serra dos Ventos*, the western watershed, which diverges into many broad but low ramifications in the N. and N.W. An immense tract of B. in the N. belongs to the basin of the Amazon, partly consisting of grassy plains (*Llanos*), and partly of marshes (*Séguas*). There are two vast river systems—the Amazon in the N., with nineteen great tributaries; and the La Plata in the S., formed by the union of the Parana and Paraguay, both of which have their head-waters in B. The only other streams of note are the San Francisco and Parahyba. The navigation of these rivers is seriously impeded by cataracts and shallows, but the Government since 1865 has diligently striven to remove such obstacles, and has organised (1873) nearly 12,000 miles of internal steam navigation. The climate, in the mountainous regions, and where temperature is affected by the sea-winds, is mild, but in the low plains and on the banks of rivers is tropically hot and unhealthy. There is much intermittent fever during the rainy season, which occurs in our winter time.

Zoology, Botany, and Mineralogy.—The Brazilian fauna is extremely rich, and its flora is one of the most wonderful in the world. The principal animals are the jaguar, wolf, tapir, deer, paca, wild boar, armadillo, and many varieties of the monkey. Of birds, there are quails, partridges, pigeons, vultures, owls, mocking-birds, parrots, and other birds of brilliant plumage. Tortoises, alligators, boas, and rattlesnakes are among the common reptiles. Everywhere, on the other hand, the most vigorous vegetation is exhibited, giving the appearance of a perpetual spring. More than 17,000 botanical species are already known, of which the most important are the famous B.-wood (q. v.), valuable alike for shipbuilding, cabinetmaking, and dyeing. The carnauba palm is a vegetable wonder. Every part subserves some important use, and from the leaves is extracted a kind of wax employed in candle-making, to the value of above £150,000 annually. The mineral treasures comprise diamonds, emeralds, euclases, sapphires, rubies, topazes, tourmalins, garnets, gold, silver, copper, lead, bismuth, iron, mercury, and manganese. Throughout B. there are abundance of mineral waters.

Commerce, Railways, &c.—The commerce of B. has greatly increased since the opening of the ports to all friendly nations in 1808. With the view of developing the resources of the country, the Government has allowed to foreign merchants the right of navigating the rivers and of coasting. The exports are coffee, representing by itself nearly the half of the whole value; cotton, a rapidly increasing staple since the civil war in America;

sugar, also rapidly increasing; dry and salted hides, caoutchouc, tobacco, maté or Paraguay tea; cacao, rum, manioc flour, gold, diamonds, &c. The exports for 1874 amounted to £3,508,473, and the imports £9,793,669. The railway system of B. is being largely developed, the Treasury having spent in 1871–72 £1,167,528 on this item alone. The completion of the systems now projected will place the capital of the empire, Rio de Janeiro, at only a few days' distance from the greater part of the central and northern provinces, and will open up vast territories, fertile and healthy, to the enterprise of the colonist. In 1873 upwards of 700 miles of railway were in the course of operation; but the construction of at least two lines has in the meantime been abandoned for want of funds. In 1874 there were considerably more than 3000 miles of telegraph lines, and in that year a transatlantic cable was laid connecting B. with Europe.

Government, Education, &c.—The executive authority is vested in the Emperor, who acts through his ministers. The Senate consists of 58 members elected for life, and the Chamber of Deputies of 122 members, elected for four years by the free population. The financial year of 1871–72, of which a definite account was rendered to the Chambers 8th May 1874, showed the revenue to be £12,976,825, and the expenditure £10,158,677. The public debt on March 31, 1874, was £61,688,782. The established religion is the Roman Catholic, but all other religions are tolerated. For administrative purposes B. is divided into twenty provinces, and the ecclesiastical jurisdiction is exercised in twelve dioceses. Education is being promoted both by Government and by private efforts, and there are night-schools for adults both in the capital and in several provinces. Normal colleges have been instituted, and popular libraries, public and private, have been established. The army for 1875 was fixed at 16,000 men; the national guard, including the reserve, was 741,782 men; and the naval force consisted of 61 ships, with 30 companies of marines, numbering 4136 men.

History.—B. was discovered in May 1500 by the Portuguese, but they founded no settlement till 1531. In 1549 they sent out the first governor, who founded the town of Bahia, where he established a regular administration. In 1578 B. was conquered by Spain, and subsequently by the Dutch Republic, which retained possession of it till 1654, when it was recovered by the Portuguese. In 1808 the troubles in the Peninsula induced the royal family of Portugal to transfer themselves to Brazil, which was raised to the rank of a kingdom. On September 7, 1822, it was declared an independent state, of which the sovereign adopted the title of emperor, and a constitution was published 25th March 1824, modified by the additional Acts of 12th August 1834 and 12th May 1840. In 1871 a law was passed by which children born of slaves were declared free, as also were all slaves in the imperial and public service. See Kidder and Fletcher, *B. and the Brazilians* (Philad. 1866), Baril de la Hure, *L'Empire de Brésil* (Par. 1862), Von Varnhagen, *Historia geral do B.* (Rio de Janeiro, 1855), Captain R. F. Burton, *Highlands of B.* (2 vols. Lond. 1869), and Stein and Hirschelmann, *Handbuch der Geographie und Statistik* (Leips. 1871).

Brazil Cabbage, or Chou Caralbe (*Caladium sagittifolium*), a plant of the natural order *Aracea*, allied to Cocco (q. v.), a native of tropical America, but now cultivated for the sake of the root, which is eaten like cocco, and the leaves, which are boiled like greens.

Brazil Grass, a commercial name for the strips of the leaves of a palm, *Chamarops argentea*, imported chiefly from Cuba for the purpose of making cheap chip or B. G. hats.

Brazil-Nuts are the seeds of *Bertholletia excelsa*, a very lofty tree growing throughout Brazil, Guiana, and tropical America generally. The seeds, termed nuts, are enclosed within a hard woody cap-

Flower, Leaf, and Section of B.-N. Fruit.

sule, closely packed together, the whole fruit forming a ball considerably bigger than an orange. The kernels are also enclosed within a hard nutshell, and present the appearance of segments of a circle, the diameter of which would average two inches. Besides being consumed as food in enormous quantities, the seeds by pressure yield a valuable oil of a pleasant nutty flavour, and is used in cooking. The oil contains 74 per cent. of elaine and 26 per cent. of stearine. Each pound of kernels yields about 9 oz. of oil, which is worth in Brazil 2s. per lb.

Brazil-Wood, the name of several trees of the genus *Casalpinia*, belonging to the natural order Leguminosæ, found in Brazil and tropical America. The wood, when newly cut, is yellow, but rapidly assumes a deep red colour; it is very hard and heavy, and of great value as a dye-wood. The wood contains a colouring principle termed Brazilin, which has been isolated by M. Chevreul. The dyeing solution is prepared by reducing the wood to powder in a mill, and extracting the colouring matter by the action of boiling water. The strained residue is repeatedly heated with boiling water, to which an alkali may be added with advantage. The solution gives a bright crimson colour on wools and silks, with an alum mordant, but the colour is not very permanent. On cotton, with a mordant of tin crystals, it yields several shades of red according to the method of treatment; but it is not commonly used in conjunction with other tinctorial agents. Varieties of B.-W. are imported under the names of Nicaragua-wood, Lima-wood, peach-wood, and Pernambuco-wood. See also SAPAN-WOOD.

Brazilian Plum. See HOG PLUM.

Bra'zing denotes the art of soldering or uniting the edges or surfaces of brass or copper by means of an alloy more fusible than the metals operated on, and composed of copper and zinc in varying proportions, sometimes with a small percentage of tin. *Soft spelter* solder, commonly used for ordinary brass work, is composed of equal parts of copper and zinc, and *hard* solder contains two parts of the former metal to one part of the latter. The process of soldering requires that the surfaces to be joined be thoroughly cleaned, which is accomplished by filing, and to prevent the oxidation of the metals, Borax (q. v.) is mixed with the alloy. The mixture of borax and solder in the state of a coarse powder is applied in a wet state; gentle heat drives off the moisture and fuses the borax, while a bright red heat fuses the solder, which on cooling joins the surfaces firmly together.

Brazos de Dios, an important river of Texas, U.S., flowing in a south-easterly direction from its source in Bexar county to the Gulf of Mexico, a distance of 900 miles. It is always navigable for 40 miles from its mouth, sometimes for 300 miles. Its valley is rich and fertile, but is still largely covered with primeval forests.

Brazza, an Austrian island in the Adriatic, the largest of the Dalmatian group, is separated from the mainland by a channel from 8 to 10 miles broad, and has a superficial area of 140 miles. Its wines are noted in the district (especially the *Vulgava* wine); and figs, almonds, and oil are also abundant. Bees and silkworms are reared, and there is a large export trade in building-stone. B. has good harbours. Pop. 15,980. The chief town is San Pietro.

Breach. See SIEGE-WORKS.

Breach, in law, means a violation of law. It has several special applications, of which the following are the most important:—

B. of Arrestment is, in Scotch law, the contempt of law committed by an arrestee who pays the sum, or delivers the goods arrested, to the common debtor. The arrestee is liable in damages to the value of the money or goods paid or delivered, with expenses. When goods are arrested, and the arrestment loosed on security, if the goods cannot be restored or their value ascertained, the surety, or 'cautioner,' is liable for the debt. See ARRESTMENT.

B. of Close means, in English law, the unwarrantable entering upon another man's property. The owner will be entitled to damage adequate to the injury. If cattle commit B. of C., their owner is answerable. In certain circumstances, however, the trespass is justifiable. It is so where one comes to demand or pay money due in the place entered, or there to execute legally any process of law. One may also legally enter an inn or similar

establishment without leave of the owner. But misconduct, or refusal to leave in proper time, is held by the law to constitute B. of C. from the moment of entry. See TRESPASS, BREAKING ENCLOSURES.

B. of Covenant renders the maker of the covenant and his representatives liable to an action. See COVENANT.

B. of Contract renders the breaker liable to action under the Common Law Procedure Act, or in the Courts of Equity. See CONTRACT.

B. of Duty may be either an offence of commission or omission; and the neglect of any action which the common sense or natural instinct of mankind points out as incumbent on any one may constitute the offence, and render the offender liable in civil or even criminal action. Thus, parents who neglect their children in serious illness may be held guilty of homicide, or even of murder.

B. of Peace.—Any offence against public safety or tranquillity is so called. See PEACE, OFFENCES AGAINST THE PUBLIC.

B. of Pound, in English law, means the breaking of any Pound (q. v.) where stray cattle are impounded, with a view to their illegal release. Stray cattle may be impounded according to law, in security of any damage which they have occasioned. The penalty of B. of P. is £5 with costs; failing payment, imprisonment with hard labour.

B. of Promise. See PROMISE.

B. of Promise to Marry. See PROMISE.

B. of Trust.—In ordinary language, one may be said to commit a B. of T. who, as trustee, acts contrary to law; but the term in law is only applied to acts in violation of the law of trust, done with intent to defraud. (See TRUST, TRUSTEE.) The distinction between B. of T. or embezzlement and the higher crime of theft is often exceedingly narrow. In Scotland, the principle has been adopted and enforced that where a person holds property without any right of administration, and is bound to hand over that property in specific form, appropriation by that holder is theft. On the other hand, when the holder has a right of management, or power, to exchange or to account for the property, or to give an equivalent, the appropriation of that property, or its proceeds, constitutes only the minor crime of B. of T. The appropriation by a watchmaker of a watch left with him to be cleaned and repaired was held to be theft; but appropriation by a pawnbroker of an article pledged has been held only as B. of T., on the ground that by lapse of time his title to the article pledged becomes absolute, and so gives him the right to sell. For a very curious question of stealing or not stealing, see the case of *Middleton*, tried before the Central Criminal Court, 23d September 1872. The Act 24 and 25 Vict., c. 96, is directed against 'frauds by trustees, bankers, directors, and others.' It specifies and defines various crimes and misdemeanours connected with fraudulent appropriation of property, and with the falsification of books and accounts, and inflicts penalties on these. See EMBEZZLEMENT.

Bread, an important and universal form of food, made by kneading the flour or meal of cereals with water into a tough and consistent paste, and baking it. The paste is generally rendered light and vesicular by gaseous carbonic acid, either evolved within the paste by employing a ferment, or introduced into it by artificial means. The earliest kind of B. was unvesiculated, and simply consisted of raw grain softened with water, pressed and baked. Cakes and analogous forms of this primitive unfermented B., made, however, with bruised grain, still constitute the principal kind of B. used by the rural population of Scotland, as well as by the inhabitants of Northern Europe, and many other parts of the globe. (See BANNOCK and BISCUITS.) Although all the cereal grains are employed more or less for B.-making in the countries where they are cultivated, only one of them—namely, wheat—is well adapted for the formation of good vesiculated B., and accordingly it is most extensively used for that purpose. There are numerous varieties of Wheat (q. v.), all containing, in slightly varying proportions, the same proximate principles, chiefly starch, nitrogenous matter, fat, and inorganic salts. The nitrogenous matter consists chiefly of gluten, a substance which gives wheat its pre-eminence over other grain for B.-making. If a small quantity of wheaten flour be placed in a linen bag and squeezed under water, the starch dissolves and passes through the bag, leaving the gluten behind. Gluten is then seen to be a grey, viscid, tena-

cious, elastic substance, and chiefly consists of vegetable fibrin. It has also adhesive properties, due to a small quantity of a peculiar azotised matter called *gliadin*. Other kinds of grain yield vegetable fibrin, unaccompanied, however, with gliadin, or associated with it to so small an extent that the elasticity and tenacity which characterise gluten, and cause it to retain carbonic acid within a paste of wheaten flour, thereby communicating lightness and porosity, are totally or nearly altogether absent.

Wheat for B.-making is first ground by being passed between two millstones, in order to detach the white, friable, starchy, and glutinous portion of the grain from its hard tegumentary coverings. The product of the attrition is meal, which contains all the elements of the grain; and to obtain the starchy powder, or flour, the meal is bolted or dressed in a hollow cylinder, which is covered with wirecloth of varying degrees of fineness, and placed in an inclined position. Within this cylinder hair brushes are fixed to a rotating rod in the axis of the cylinder, and when the meal is introduced at the raised end, the brushes force the flour, according to its fineness, through the meshes of the gauge. Dressing thus yields flour of different qualities, called *firsts*, *seconds*, and *thirds*; and the husky particles that pass out at the low end of the cylinder are again sifted, and form, according to fineness, pollards, sharps, and bran. Fine flour, or firsts, is used for B. of a superior quality to the ordinary or household B., which is made of seconds and thirds of variable proportions. Dr Letheby gives the composition of flour as follows:—

Nitrogenous matter	10.8
Starch, dextrin, &c.	70.5
Fatty matter	2.0
Mineral matter	1.7
Water	15.0
	100.0

Loaf-B., or ordinary fermented B., has a firm porous texture, induced by *panary* fermentation by means of leaven, yeast, or other ferment, which converts a portion of the starch of the flour into dextrin and grape-sugar, and splits up the latter into alcohol and carbonic acid. (See FERMENTATION.) If a mixture of flour and water be kneaded into a stiff paste or *dough*, and laid aside in a warm situation, decomposition ensues. The dough in this active condition is called *leaven*, and if kneaded with a large quantity of flour and water, it sets the whole mass into active fermentation, rendering it light and spongy by the evolution of carbonic acid. Leaven was employed in remote times, and is still used in Germany and France in B.-making. Its uncertain action, however, has led English bakers to adopt Yeast (q. v.) as a substitute. There are various kinds of yeast—brewer's yeast or barm, German yeast, and *patent* yeast, prepared by fermenting a little hops and malt with brewer's yeast, and adding boiled and mashed potatoes and flour.

In the manufacture of fermented loaf-B., the baker first takes small quantities of tepid water, yeast, and salt, and proceeds to knead some flour with them. The *sponge* so formed is then set apart in a warm place till fermentation ensues, and the mass rises and falls with the evolution and escape of carbonic acid. When the action has proceeded far enough, the remainder of the flour, salt, and water necessary to make the proper amount of dough is laboriously and intimately kneaded with the sponge, and the whole again laid aside for some time, during which the fermentative action permeates the mass of dough, and increases its bulk by the formation of innumerable bubbles of carbonic acid. A second kneading operation gives a uniform consistence, and distributes the carbonic acid equally throughout the mass, therefore preventing it from becoming *sad* or ill raised. The dough is then shaped into loaves, and during the short time that elapses before their introduction into the oven, each loaf swells up, or gives *proof*. On being baked by exposure to a high temperature in an oven for an hour, the expansion of the confined gas within the loaves still further increases their bulk, so much so, that on being withdrawn from the oven, they are twice as large as when they entered it. The heat of the oven stays the fermentative action and expels the alcohol thereby formed. One important duty of the baker is to check the fermentation at the proper point, for if it is carried too far it leads to acetic fermentation, rendering the B. sour and unpalatable, and if not prolonged enough the dough does not rise sufficiently. Flour, in being converted into B., in-

creases considerably in weight by absorption of water, and it is found that one cwt. of flour yields about 140 lbs. of B. In the baked loaf, the starch, though swollen, remains unaltered in the crumb, and in the crust is transformed into dextrin. A dark colour is imparted to the crumb of the loaf when too much starch is converted into dextrin and sugar, which in course of fermentation always takes place in a slight degree. Advantage is often taken of the property possessed by alum of hindering this change to render inferior flour, which is much more susceptible of it than fine flour, suitable for B.-making, and, by adding alum in sufficiently large, though deleterious, quantity, a loaf may be manufactured from deteriorated flour rivaling in whiteness that made from the finest flour. Salt, while it flavours B., gives whiteness and firmness to it. Yeast, leaven, or other ferment, is not essential to the formation of good vesiculated B., for lightness and porosity may be imparted by means of effervescing compounds. For instance, B. of fairly good quality is made by mixing a little hydrochloric acid and carbonate of soda in the dough unflavoured by salt; when the proper proportions are taken, the acid is neutralised by the alkali, common salt (chloride of sodium), and carbonic acid being formed, the dough is flavoured and changed by charging it with vesicles. Carbonate of ammonia is also sometimes employed to lighten the dough, being completely volatilised by the high temperature of the oven—the apparently objectionable qualities, strong taste and pungent smell, of the substance being in no wise imparted to the dough. (See AERATED B.) Brown B., which is made of coarse wheaten flour, owes its colour to a peculiar nitrogenous body closely allied to diastase, called *cevalin*, which was discovered and described by M. Mège-Mouriès, and is present in largest quantity in the external portions of the wheat-grain. Brown B. is commonly thought to be more nutritious than white B., but is in reality not so. Its laxative property arises from the indigestible particles of the cuticle of the grain acting as a mechanical irritant on the alimentary canal. See NUTRITION and FOOD.

Breadalbane (Gael. *Braidalbainn*, 'the hill country of Albainn') is one of the old stewardries of Perth, and lies in the W. part of the county. The district known by the name is about 33 miles long and 31 broad, reaching from Lochaber and Atholl on the N. to Strathcarron and Menteith on the S. It lies in the heart of the Grampian mountains, has no towns, and few villages. Loch Tay is the principal sheet of water. It gives the title of marquis to a branch of the Campbells, to whom nearly the whole of B. belongs.

Bread, Army. The B. now supplied to the regiments of the British army is baked at the encampment or barracks where the regiment is quartered, by duly qualified persons. The wholesomeness of the B. is thus ensured; and even when, in certain cases—e.g., when the detachment is small—the B. is supplied by contract, it is subjected to a strict supervision before it is used. Formerly all the A. B. was supplied by contract; but a few years ago it was discovered that the A. B. was of such wretched quality that a reform was necessary, and accordingly, after several experiments, the present system was adopted.

Bread-Fruit Tree

(*Artocarpus incisa*), a tree of the natural order *Artocarpaceæ*, a native of the islands of the Pacific and of the Indian Archipelago, the fruit of which supplies a great portion of the food of the natives of these islands, while the bark is used for clothing, the timber for canoes, house-building, furniture, &c., and the milky juice, which exudes when the

Bread-Fruit.

bark is punctured, is, when boiled with cocoa-nut oil, employed as birdlime, and for making the seams of canoes and various

domestic vessels water-tight. The fruit is about the size of a child's head, and is gathered before it is fully ripe. It is cooked by being baked in an oven, or the fruits are allowed to ferment, and then beaten into a paste, which is sourish, but will keep for some time. There are several varieties of B.-F., ripening at different seasons. It has been introduced into S. America and the W. Indies, and it may be remembered that the mutiny of the *Bounty*—so famous in sea-story—happened in the course of a voyage to introduce the B.-F. into the Antilles. In these islands it is, however, not so much valued as the plantain. The *Yak, Yacca*, or *Jack-Fruit* is *A. integrifolia*, and is largely used as food by the natives of Ceylon, Southern India, and other parts of tropical or semi-tropical Asia. The seeds when roasted are also much esteemed, and the timber is much used for furniture. The inner wood (*duramen*) is used to dye the robes of the Buddhist priests of a yellow colour. The *Dephall* (*A. Lakoocha*), a native of the E. Indies, is another member of this genus.

Bread-Nuts, the edible seeds of *Brosimum Alicastrum*, which belongs to the same order as the Bread-Fruit (q. v.). The wood is somewhat like mahogany, and in Jamaica is used by cabinetmakers. The leaves and young shoots are eaten by cattle, but become deleterious when old. The beautiful mottled heart-wood of *B. Aubletii* (the letter-wood, snake-wood, or leopard-wood of Trinidad and British Guiana) is used for veneering and for making walking-sticks.

Bread-Room, as a nautical term, means the place where the biscuits are stored. In the Navy it is carefully constructed, and kept as warm and free from damp as possible.

Bread-Root. See PSORALEA.

Bread-Tree. See CAFFRE-BREAD.

Breakers are waves that break or fall over, on account either of the shallowness of the water, or of rocks a short distance under the surface. Their foam and roar are sharply looked after and listened for at sea, on account of the danger they indicate. In a gale the tops of the seas break, owing to the progressive motion of the water at the surface before the wind. This is very dangerous for open boats.

Breaking Bulk, a Scotch law term, signifying the making use of an article bought, by which the buyer is debarred from afterwards objecting to the article and returning it to the seller.

Breaking Enclosures, a term in the law of Scotland somewhat analogous to that of Breaking of Close (q. v.) in that of England. Several old Scotch Acts are designed specially for the encouragement of planting and enclosing. They inflict penalties on persons or their cattle found guilty of trespassing on the lands so protected. By common law, also, injuries done to trees and enclosures are punishable as malicious mischief.

Breaking Joint is an arrangement used in construction in iron and other materials, analogous to Bouding (q. v.) in brick-work and masonry. The phrase implies that the joints in contiguous strakes, or layers of plates, should not be in line with, or over each other, in order that the structure may be as little weakened by them as possible.

Breaking of Prison is the crime of escape by one lawfully imprisoned, whether effected by violence or by corruption. The punishment is arbitrary.

Breakstone, an old name for the *lady's mantle* (*Alchemilla vulgaris*), derived from the popular belief in regard to its action in stone and gravel. It is somewhat tonic and astringent.

Breakwater, a structure built to shelter a harbour or roadstead from the action of the waves, and thus to provide safe anchorage for vessels. Breakwaters may be entirely cut off from the shore, across the entrance of a bay, as at Plymouth; but frequently they resemble piers in having one end connected with the land, as at Holyhead. They may be divided into two classes according to their construction: they are either walls of solid masonry or concrete, with nearly vertical faces, which reflect the waves, or else are broad mounds of stone, with long and gently-inclined seaward faces, upon which the waves break. To the former

class belongs the B. now in course of construction at Dover, and the new South B. completed in 1873 at Aberdeen. The Dover B. is of ashlar masonry filled up with Concrete (q. v.). The work is carried on with diving-bells, and has proved exceedingly difficult and expensive. The Aberdeen B. had its foundation made by depositing *in situ* large bags of liquid concrete, which hardened rapidly under water. The surface of these bags was prepared by helmet-divers to receive the superstructure, which, up to low-water level, consisted of concrete blocks weighing about 20 tons each. The upper part of the B. is concrete also, and was deposited liquid in cases, holding hundreds of tons each. Finally bags, each containing 100 tons of liquid concrete, were deposited as an 'apron' round the foot of the B. The engineer of this structure was Mr W. Dyce Cay. Among the best-known breakwaters of the other class are those of Plymouth, Portland, Cherbourg, and Holyhead. The latter was designed by the late Mr J. M. Rendel; the necessary Act of Parliament was passed in 1847, and the B. was formally declared complete by the Prince of Wales in August 1873, although the partially-formed harbour had proved itself of great value to shipping long before that date. This gigantic structure consists of a mound of rubble 7860 feet long, and 400 feet broad at the base, the depth of water (spring tides) being over 50 feet. The mound is surmounted near its inner side by a massive masonry wall about 40 feet high, on the harbour side of which is a lower terrace, or quay wall, that may possibly be used for

wharfage at some future time. The mound contains about seven million tons of stone (obtained from quarries close at hand—see BLASTING), and the whole B. cost about £1,285,000, or about £163, 10s. per foot run.

Bream, a name applied popularly, and without scientific or plausible reason, to various different genera of fishes. The B. proper of ichthyologists is a fresh-water Teleostean fish, belonging to the *Cyprinidae* or carp family, and scientifically known as *Abramis brama*. It is occasionally known as the 'carp B.' The B. genus *Abramis* is nearly allied to the *Cyprinus* or carp genus, but the members of the former group possess compressed bodies, convex in outline above and below, and are not provided with spiny rays in the dorsal and anal fins. No barbules surround the mouth. The common B. is found in most European lakes and slowly-running rivers. It is plentiful in the Cumberland Lakes. It is yellowish white in colour, the cheeks and gill-covers being of silvery hue. This fish may attain a weight of 14 lbs. The flesh is not very rich, although it was formerly accounted a savoury article of diet. Chaucer's *Frankelene*, who was 'Epicurus' owne sone,' had 'many a breme and many a luce in stewe.' The white B. (*A. blicca*) is of a uniform silvery or greyish colour, and resembles the common B. in its distribution. A species named the Pomeranian B. (*A. Buggenhagii*), occurring chiefly in Pomerania, but also in Britain, has a thicker body than the common B., larger scales, and the tail less acutely forked. The name sea-B. has been variously applied to the genus *Brama* (q. v.), belonging to the family *Chatodontidae*; to the genus *Pagellus* or *Sparus*, belonging to the family *Sparidae*; and to the Gilt-head (q. v.) (*Chrysophrys aurata*) of the latter family.

The carp B. is most frequently caught by anglers, and is caught in much the same way as Barbel (q. v.). The bait consists of red worms or lob-worm. The B. spawns about the end of May or beginning of July, and seems generally to inhabit deep holes, and clay or sandy bottoms. These fishes frequently approach the surface of the water.

Breaming, a nautical term, used to denote the cleaning of the bottom of a ship by fire. The ship is laid aground, and fire is applied to the bottom, which loosens the pitch, or composition of sulphur and tallow, with which it is covered to pro-

tect it from worms. This is then scraped off, along with the barnacles, grass, weeds, and other filth which are found adhering to it.

Breastplate, a plate of iron, steel, or other metal, worn upon the breast in former ages as a piece of defensive armour.

There was also a backplate to protect the back. See CUR-RASS.

Breastplate.

Breasts (*mammæ*) are the glands which secrete the milk in the human female. They are two in number, and are placed in front of the chest, one on each side. They are conical in shape, and at the summit have a prominence called the nipple. The skin around the nipple is darker, and is covered with sebaceous glands. This coloured circle (*areola*) round the nipple is of a

rosy pink in the virgin, but during pregnancy, and during lactation, is much darker, and never afterwards fully regains its original rosy hue. The B. exist also in the male, but only in a rudimentary state; even in the female they are in infancy only rudimentary, and develop as she approaches puberty. They increase much during pregnancy, and atrophy or become small in old age.

Structure of B.—They are glands divided into distinct lobes, each lobe having a separate duct, called milk-bearing ducts. These are from 15 to 20 in number; they converge towards the nipple side by side without communicating with each other, and open on the surface of the nipple by separate openings.

The B. are liable to certain diseases. They are a common seat of several tumours, as fatty, fibrous, and very specially of *Hard Cancer* (q. v.). These tumours require to be removed with the knife. The B. are liable to inflammation, often going on to suppuration and formation of abscess. This generally begins with shivering, pain in the B., heat and swelling in the part, and great disturbance of the general health. The treatment consists in hot poultices or fomentations, and opening early to relieve pain. When an abscess forms, it is to be opened with a free incision.

Breast-Wheel, a vertical water-wheel in which the water enters the buckets at some little distance below the highest part of the periphery, and which is fitted with a casing, or *breast*, extending downwards from the point where the water enters to the tail-race, nearly fitting the outside of the wheel, and so preventing the water leaving the buckets too soon.

Breastwork, in fortification, is a mass of earth raised to protect troops against the fire of an enemy. It is generally not so high as to require a banquette for the defenders to stand on when they fire over its crest.

Breath and Breathing. See RESPIRATION.

Breath, Offensive, may arise from many causes, and treatment will depend very much upon the cause of the B. O. It often arises from a decaying tooth. This odour is most offensive. It may arise from particles of food lodging in a decaying tooth and becoming putrid. In both cases great care must be paid to cleanliness, either having the stump extracted or all decaying matter carefully washed out from time to time. B. O. may arise from ulcers of the mouth, nose, or throat. In all such cases benefit will be derived by gargling the mouth well with chlorine water, charcoal, Condy's fluid, or some other disinfecting agent. B. O. is sometimes due to disease of the lungs, as gangrene, or abscess of the lungs. In such cases, small doses of turpentine internally will greatly benefit the patient. When B. O. is due to indigestion, purgatives, combined with proper attention to diet, and giving such medicines as charcoal or sulphite of soda internally, will do much to remove the B. O.

Breccia, a number of angular fragments of any hard rock, cemented into a compact mass by carbonate of lime or any other enveloping medium. When the fragments are rounded,

the mass is called pudding-stone. They show no trace of magnetism, but take on a fine polish.

Breche-de-Roland, a narrow pass of the Pyrenees between France and Spain, about 20 miles S. of Bayonne, and 9500 feet above the sea. It takes its name from the famous nephew of Charlemagne, who was slain at Roncesvalles by the Biscayans while leading the rearguard of the Frankish army back from Spain.

Bre'chin, a town of Forfarshire, on the S. Esk, 5 miles W. of Montrose by a branch railway, has considerable linen-weaving, flax-spinning, bleaching, distilling, and brewing. It is an old town, and was the seat of a Culdees house in the 10th and 11th centuries, and subsequently of a bishopric, founded by David I. in 1150. A portion of the cathedral, dedicated to St Ninian, is now the parish church, which contains a beautiful Gothic window. Near the church is a singular tower, 85 ft. high, 25 in diameter at the base, and 12½ at the top, crowned with a spire of 25 ft. It is like the Irish round towers, and is the only specimen of the kind in Scotland besides that at Abernethy. B. was formerly a walled town, and was burned by Montrose in 1645. It was defended by a strong castle, which stood a siege of twenty days before being taken by Edward I. in 1303. This was the seat of the Maule family, now represented by the Marquis of Dalhousie, and which has been rebuilt on the ancient site. Gillies, the historian of Greece, Maitland, author of the Histories of Edinburgh and London, and Dr Guthrie, the celebrated pulpit orator, were born at B. Along with Montrose, Forfar, Arbroath, and Bervie, B. returns one member to Parliament. Pop. (1871) 7959.

Brecknock (Welsh, *Brecheinog*), the county town of Brecknockshire, S. Wales, beautifully situated at the confluence of the Usk, Honddu, and Tarell, 50 miles N.E. of Bristol, with manufactures of coarse woollens, flannels, hats, and hosiery. It is now one of the railway centres of S. Wales, and a place of growing prosperity. It was founded in 1094 by a Norman adventurer, Bernard Newmarch, who here built a castle and two priories, one of which was converted by Henry VIII. into a college, restored in 1864. An Independent college was also founded here in 1867. B. lies at the N. base of the Beacon. The town was formerly surrounded by a wall and a moat. It is the birthplace of Dr Hugh Price, founder of Jesus College, Oxford, and of Mrs Siddons, the famous actress. B. returns one member to Parliament. Pop. (1871) 5845; of parliamentary borough, 6308.

Brecknockshire, a county of Wales, in the basin of the Usk, with an area of 719 sq. miles, or 460,158 acres, and a population (1871) of 59,901. It is in great part mountainous, abounds in picturesque scenery, and is watered by the Wye, Usk, Yrfon, Claerwen, and Tawe. The Black Mountains extend along the S., and have their greatest height in the Beacon, 2685 ft.; while in the N.W. rises the lower range of the Mynydd Eryn. In the N. and W. the formation is Silurian; all the rest is Devonian. The quality of the soil varies greatly, and only about a half of it is cultivated, the products being chiefly oats, barley, and wheat. There is much pasture, and a considerable trade in wool, butter, and cheese. B. is rich in minerals, the most extensively wrought being iron, coal, lead, copper, and limestone. The only considerable manufactures are coarse woollen cloth and worsted hosiery. Three main lines of railway intersect the country, and the B. Canal stretches to the Bristol Channel. Among the chief towns are Brecknock, Builth, Crickhowell, Hay, and Llanely. Welsh is the language of nearly half the inhabitants. The county returns one member to Parliament. In ancient British times B. was inhabited by the Silures, of whom it still retains many memorials in cromlech, mound, and cairn. There are also many remains of Roman camps and roads.

Bre'da (Dutch, *Brède*, the flat meadow-land; the word is the same as the Eng. *broad* and the Ger. *breit*), a strong town of N. Brabant, Holland, at the confluence of the Merk and the Aa, with a Gothic cathedral and an old castle, rebuilt in 1696 by the Prince of Orange, then William III. of England. It was for a time occupied by Charles II. while in exile. B. has manufactures of linen, carpets, leather, &c., and breweries and dye-works. Although it has lost much of its military importance, it

still possesses the means of laying the adjacent country, which is flat and marshy, under water. It came into the possession of Spain in 1567, and, after numerous vicissitudes of fortune, was in 1813 surrendered by France to the House of Orange. Pop. 15,282. B. was the scene of two congresses—(1) that of 1566, in which the Dutch nobles demanded from Spain the abolition of the Inquisition and of persecution for religion; (2) that of 1746-47, when France, England, and Holland met to arrange terms of peace. Both proved failures. The *Peace of B.*, 31st July 1667, ended the naval war in which England, France, Holland, and Denmark were embroiled through commercial jealousies.

Bre'sdow, Gabriel Gottfried, a German historian, born at Berlin, 14th December 1773, educated at the Joachimsthal Gymnasium and at Halle, and in 1796 became schoolmaster at Cutin. Here he devoted himself with great earnestness to a study of the geography and astronomy of the ancients. The fruits of this labour were his *Handbuch der alten Geschichte, Geographie und Chronologie* (Alt. 1803; 6th ed. 1837), and his *Untersuchungen über einzelne Gegenstände der alten Geschichte, Geographie, und Chronologie* (Alt. 1800-2). In 1804, 'B. was appointed Professor of History at Helmstedt, where he published for some years the *Chronik des 19 Jahrh.*, but afterwards returned to his favourite studies, and planned a great work on the history of all systems or conceptions of geography, from Homer down to the middle ages, only a small part of which he executed. In 1809 he was called to the University of Frankfurt-on-the-Oder, and in 1811 to Breslau, where he died, 5th September 1814. B.'s schoolbooks are very widely used in Germany; as his *Merkwürdige Begebenheiten aus der Allgemeinen Weltgeschichte* (Alt. 1810; 26th ed.), and his *Umständliche Erzählung der merkwürdigsten Begebenheiten aus der Allgemeinen Weltgeschichte* (Alt. 1810; 13d ed. 1852). See Kunisch, *B.'s Leben und Schriften* (Berl. 1816).

Brée, Mattheus Ignazius van, a Flemish painter, born at Antwerp in 1773, studied there and afterwards at Paris, and became one of the restorers of historical painting in Holland after the manner of David. He earned his reputation by his 'Death of Cato' (1798). Among his most famous works is that of the Leyden burgomaster in the act of addressing his famishing townsmen during the siege of 1576, and offering his body to be parted among them. It now hangs in the Leyden Townhouse. Other works are 'Rubens Dictating his Dying Testament,' and the 'Tomb of Nero.' He was remarkably rapid in sketching and securing effect. B. died, Director of the Academy, Antwerp, 15th December 1839.

Breech, the part of a cannon or the end of the barrel of a firearm farthest away from the muzzle. Technically, when applied to muzzle-loading small-arms, the plug closing the rear end of the barrel. When applied to breech-loaders, it may mean either the rear end of the barrel or the mechanism closing it.

Breeches Bible, the name given to the celebrated *Geneva Bible*, on account of its translation of Genesis iii. 7, where the 'aprons' of the authorised version is rendered 'breeches.' This edition, published in 1557, was the work of English divines, persecuted from the country; and in it the text was first divided into verses.

Breeching, a naval term, meaning a strong rope by which the recoil of a gun or carronade is checked when the muzzle is so far within the porthole that the gunner can sponge and reload it.

Breech-Loading Arms are firearms loaded at the breech, as contradistinguished from those which are loaded from the muzzle. Though it is only within the last twelve years that the B.-L. system has been brought prominently into notice, it is not a modern invention, B.-L. A. having been in use more than three centuries ago. The earliest of which the date can be identified were made in 1537, and are of British manufacture. A perfect specimen, bearing the above date, is preserved in the Tower of London.

The early B.-L. A. were chamber-loaders—i.e., they had a detached loading-chamber at the breech, into which the charge

was inserted, instead of being contained in a cartridge, as is the case with modern breech-loaders. Owing, however, to the difficulty of closing the breech so securely as to prevent an escape of gas, which was nearly as dangerous to the party using the weapon as to those it was used against, the early B.-L. system may be said to have been a failure, and it is only during the present generation that the system has been employed with practical effect.

B.-L. A. were and are employed both for military and sporting purposes, and are of two classes—breech-loaders in the ordinary sense of the term, and repeaters; but it is intended to confine this paper exclusively to military breech-loaders; sporting and repeating arms being noticed under other headings.

The war between Prussia and Denmark in 1864, and between the former country and Austria in 1866, in both of which the Prussians used the B.-L. needle-gun with great effect, seems to have been the means of arousing the attention of all nations to the importance of B.-L. A.; although previous to 1864 such arms had been experimented with by various European Governments, and amongst others by that of our own country (two regiments of British cavalry having been armed with the Sharp B.-L. rifle in 1857, and the Terry and Westley-Richard rifle having been issued to a limited extent between 1857 and 1861).

In 1864 the British Government invited gunmakers and others to submit plans for converting the muzzle-loading Enfield to a breech-loader. About fifty different systems were submitted, and in the beginning of 1865 the Snider action was finally adopted. It was, however, only considered as a makeshift for the conversion of the large stock of muzzle-loading rifles then in hand, the question of the ultimate selection of a pattern on which to manufacture new weapons being left open.

In 1868 a committee was appointed by the Government to consider the question of B.-L. small-arms, with the view of selecting a rifle to replace the Snider. No less than 104 arms of different patterns were submitted to and examined by the committee, and after a preliminary trial, ten were selected for further experiment—four of which were on the bolt, and six on the block system. After farther trials with defective cartridges, the whole of the bolt systems were rejected as dangerous, and farther competition restricted to the block system, the prize being ultimately awarded to the Henry rifle. Instead, however, of recommending this weapon as a whole, the committee decided to deal with the barrel and breech action separately. After exposure, endurance, and rust tests, the arms left in the competition were reduced to two—viz., the Henry (sliding block), and the Martini (falling block). These were reported equal in safety and strength, but the Henry barrel far surpassed the Martini in accuracy; the Martini being a self-cocking action, it required one motion less to load and fire than the Henry; and on these grounds the committee recommended the adoption of the Henry barrel and Martini breech, and these being adapted to each other, and the arm christened the 'Martini-Henry,' it was finally selected as the weapon for the British army.

Meantime other nations have not been idle, and most of the European powers have their troops now armed with breech-loaders, though scarcely two countries have adopted the same system.

It would be impossible here to give anything like a detailed description of the various B.-L. A. actually in use at the present moment, while a mere catalogue of those proposed and abandoned within the last few years would form a long list. All that can be done, therefore, is to give a short description of the representative guns of the various systems.

Modern breech-loaders may be said to be divided into two main divisions—viz., the bolt and the block systems. In the former, the plug which closes the breech is advanced between guides, and fastened by a partial turn on its axis like an ordinary street-door bolt; while in the latter, the breech is closed by a block sliding in a vertical slot, or moving on an axis at the rear end or side of the barrel. The former is the plan generally adopted on the Continent, while the block system, in various forms, has found most favour in England and America.

The foremost weapon on the bolt system is the Prussian needle-gun, which was patented in England by Abraham Adolph Moser in 1831, and after some improvements by Dryse, a gunmaker of Sommerda, whose name it ultimately came to bear, it was adopted by the Prussian Government, and put into the

hands of their troops in 1848. This action is shown in Figs. 1. and 2.

The breech is opened by drawing back the bolt B in line with the barrel, and closed by pushing the bolt, the front end of which forms a conical cup, forward against the barrel, in which position it is secured by turning the knob or lever O a quarter of a circle to the right. The explosion of the cartridge, C, is effected by a steel needle, N (Fig. 1), which is driven forward by a spiral

Fig. 1.

spring. The needle pierces the case of the paper cartridge, passes through the powder, and strikes the fulminate inside, a cap situated within the cartridge and immediately behind the bullet, as shown in Fig. 2. The base of the bullet is fitted into a sabot made of compressed paper, which is forced into the grooves of the rifle by the discharge, and causes the bullet to rotate with it. The cartridge being a self-consuming one, no extractor is required.

Fig. 2.

The breech action consists of three concentric hollow cylinders, with the spiral spring and needle-carrier A within the last; the whole working in a shoe into which the barrel is screwed, and which is attached to the stock. This shoe is open at the rear end, and immediately behind the barrel a space is cut in it sufficient for the insertion of the cartridge, while from this space to the rear a groove is cut sufficient to allow the knob or lever to pass along it.

In loading the gun, the first action is to withdraw the needle from the barrel by means of the thumbpiece E in rear of the lock, as shown in Fig. 1, pressing at the same time the spring-catch F, which requires releasing to allow of its withdrawal. The bolt-handle O is next struck upwards, so as to release it from the side-catch into which it fits when the breech is closed, and the bolt B drawn backwards, carrying the needle N and spring with it, thus opening the breech. The cartridge is then inserted into the chamber as shown at Fig. 1, and the breech closed by pushing the bolt forward and turning the handle to the right. The cocking is then effected by pushing in the end thumb-piece E to its original position, in which it is retained by the spring-catch F; this compresses the spring, the shoulder on the needle-holder A being held fast by the trigger-catch I, which allows it to pass backward when the sliding bolt B is withdrawn, as in Fig. 1, but catches and detains the needle-holder when the bolt is pushed forward again for closing the breech. The gun is fired by pulling the trigger T, which releases the needle-holder A, and allows it to be driven forward by the compressed spring, as in Fig. 2.

It has latterly been the fashion to speak rather disparagingly of the needle-gun, and although it may now be said to be obsolete, it at least, through the events of 1864 and 1866, was the means of converting the world to a belief in B.-L. A. for military purposes. But, under the name of 'Prussian needle-gun,' we are really considering a whole series of arms. Dryse, who took up the invention, never ceased to improve and alter it; and before his death had succeeded in adapting it for a metal cartridge, which experience has shown to be a necessity for any breech-loader. It is the parent of the Chassepôt, Beaumont,

Mausier, Vetterlin, and a host of modern plans; in fact, all modern breech-loaders on the bolt system resemble it more or less in some respects.

Coming to the block system, the Sharp (American) may be taken as the earliest. The breech action consisted of a vertical block moving in a slot in rear of the barrel, and depressed or raised by a lever forming the trigger-guard, the upper edge of the block being sharpened so as on being raised to cut off the end of a paper or linen cartridge previously inserted into the barrel, and the ignition being effected by means of a strong percussion-cap on a nipple outside the barrel, as in the muzzle-loading arms. This system of ignition is, however, now obsolete, the great escape of gas at the breech in all actions in which such a system of ignition was used proving detrimental to steady shooting. This defect was only obviated by the adoption of a metallic cartridge-case containing its own ignition.

Of modern systems of block actions, the Snider, Martini, and Henry each merit a brief description.

As previously explained, the Snider action was adopted by the British Government after a competitive trial as the best mode of altering the then existing stock of muzzle-loading rifles to breech-loaders. Since its first adoption various alterations and improvements have been made upon the action, but its characteristic features still remain. Figs. 3 and 4 show the action with all its latest improvements (No. 3 pattern).

In converting a muzzle-loading Enfield on the Snider system, the barrel is shortened by about 2½ inches, and the rear end

Fig. 3.

Fig. 4.

screwed into the shoe A, to the right side of which the solid breech-block B, which closes the breech, is hinged upon a longitudinal pin. When closed, this block fits into the shoe, its front end fitting close up to the breech-end of the barrel, and its rear end bearing against the solid face of the shoe, the block being securely locked by the spring-catch C. In opening the breech, the lever D is pressed by the thumb, by means of which the spring-catch C is withdrawn, and the block is then lifted and turned over laterally, as shown at Fig. 3. The cartridge is then inserted into the chamber, and the breech-block turned over into the shoe. The firing of the cartridge is effected by the ordinary side-lock, the hammer H of which, on pulling the trigger, acts upon the piston J, which passes through the breech-block obliquely, causing its point to impinge upon a percussion-cap in the centre of the base of the cartridge-case; the piston, on the hammer being raised, is drawn back into the breech-block by a light spiral spring. After firing, the empty cartridge-case is extracted by the extractor E, which slides upon the hinge-pin of the breech-block. The block itself is made to slide longitudinally upon the hinge-pin for a short distance, and on being fully opened is drawn back by the hand, carrying the extractor with it; and the latter having hold of the cartridge-case under the base flange, draws it out of the barrel. The block on being let go is returned to its original position by the spiral spring.

The Martini-Henry B.-L. rifle, which has been selected for adoption in the British army, is compounded of two independent inventions, viz., the action, invented by Mr Martini, a Swiss engineer; and the Henry barrel, the invention of Mr Alexander Henry, gunmaker, Edinburgh. As the latter will fall to be treated of under the head of RIFLES, it is only the breech action which requires to be described in this article.

In this action (Figs. 5 and 6) the breech is closed by a longitu-

Fig. 5.

dinal falling block, B, working in a morticed steel body, which forms as it were a box or case to contain the mechanism. The block is hinged on a transverse pin passing through the sides of the body at its rear end, the end of the block being rounded off and fitting into a corresponding hollow in the body, so as to form a perfect knuckle-joint, A. The arrangement for ignition consists of a direct acting striker or piston, J, impelled by a spiral

Fig. 6.

spring, both being contained within the falling block. In manipulating the rifle, the lever L is thrown smartly forward, and its inner arm, coming in contact with the hook D on the breech-block, draws it downward. At the same time the tumbler C, the point of which fits into a slot in the striker, is carried back with the lever, carrying with it the striker J, and compressing the spiral spring. The block, in falling, strikes the legs of the cranked extractor E, the upper prongs of which, fitting round the base of the cartridge-case, are thrown backward, thus ejecting the cartridge-case, as shown in Fig. 6. The front end of the block falls sufficiently to clear the breech end of the barrel, and its upper side is hollowed out and forms a groove to allow of the free entrance of the cartridge G into the barrel. On a cartridge being inserted, the lever is drawn backwards, and its inner end raises the breech-block, and closes it securely over the end of the barrel, the tumbler C, which holds back the striker and spring, being meantime retained at full cock by the tumbler-rest and trigger, H and T. There is a small spring-catch, K, in the stock, into which fastens the outer end of the lever and prevents it falling and opening the breech. On the trigger being pulled the tumbler C is released, and the striker J impelled against the cap in the base of the cartridge by the spiral spring which had up to this time been held compressed by the tumbler. A small indicator outside the body, and working on the same axle, serves to show when the rifle is cocked.

From the above description, it will be seen that the mere motion of the lever forward opens the breech, cocks the rifle, and extracts the cartridge. The stock of the Martini-Henry is in two parts, the butt being attached by a bolt through its centre screwed into the rear of the morticed steel body. The barrel is screwed into the front of the same body, and the fore end of the stock attached to it by bands.

The breech action shown in Fig. 7 is a recently improved construction of the vertical-sliding block action, the invention of Mr Alexander Henry of Edinburgh. The breech-block A is a stout block of steel, moving vertically in a slotted body at the rear end of the barrel. This block is attached to the

lever B, which forms the trigger-guard by the links C on each side, leaving space for the hammer between them, while the front end of the lever is hinged to the trigger-plate. The mainspring D is in front of the action below the barrel, while the hammer

Fig. 7.

and extractor, E F, are both jointed on one hollow axle passing through a projection on the trigger-plate. On opening the lever, the breech-block is drawn downwards by the links, and the bottom of the latter when descending acts on curved feathers or projections on the hammer, drawing it back to full cock, where it is retained by the point of the sear G. On coming to full cock, the outer end of the hammer acts on the back of the extractor, throwing forward its upper end and ejecting the empty cartridge. On a cartridge being inserted, the lever is raised, carrying the block upwards and closing the breech; and on the trigger H being pulled the hammer is released, its point striking the cap in the cartridge through a small hole in the face of the breech. A small catch, J, in the end of the lever, keeps the latter in position when closed, and can at the same time be used as a bolt for bolting both trigger and lever when the rifle is at full cock.

The following table shows the rifles in use at present by the principal powers, with their relative weights, &c. :-

Breed, a perpetuated variety or race of animals, generally formed and induced by man, through a process of artificial selection. A *variety* of animals springs from deviations in a *Species* (q. v.). When such deviations become permanently embodied and perpetuated, the variety is termed a race or B. We are accustomed to speak of the various *races* of men, and of the *breeds* or perpetuated varieties of domestic animals, such as the horses, sheep, oxen, &c., and of birds, such as the pigeons. In plants, also, and perhaps in greater profusion than in animals, instances of specific variation, productive of varieties and breeds, are found. The varieties of roses, and of many other flowers and vegetables produced by artificial selection and cultivation, are too well known to require further enumeration. The *mode* in which breeds of animals and plants originate forms a very interesting topic, but, at the same time, a subject very difficult of elucidation and satisfactory or clear explanation. Mr Darwin has laid great stress on the primary *variation of species* in his theory of descent by *natural selection*. He thus supposes that in nature there is an endless tendency to greater or less variation in every species of animal and plant; and that this variation proceeds by nature *selecting*, as it were, those individuals which vary most from the original stock to carry on and perpetuate the variety, and so to form a race or B. These races or breeds, Mr Darwin holds, will in time also vary, as did the

original species; and the degree of variation from the original species will at last come to be so great, that a new *species* will be thus evolved by variation from the former one. In this view—which is supported by the consideration of our domestic animals—breeds or races mark a kind of intermediate stage of variation, which process is tending to evolve new species. But admittedly it is very difficult, and in some cases impossible, to pronounce where the mere B. or variety ends, and where new specific characters may be said to have been formed.

There is no doubt, however, that many of the derived breeds or races of pigeons, for example, differ as widely among themselves as other and admittedly distinct *species* of birds differ. And so with cattle, horses, and sheep, where the process of *artificial breeding* or *selection* has operated to produce varieties so different from the original species, that they might structurally be deemed distinct species.

Man, by *artificially* selecting animals possessing certain desirable characters, and by mating such, produces a new B. or variety, which combines the characteristics of the parents. The science of *breeding* is to a very great extent based on empirical laws—the results of experience; and it is one of the chief difficulties, alike of the breeder and theorist, to determine where the limits of fertility and sterility end or begin. (See HYBRID.) The chief points to which the breeders of sheep have paid attention are the character of the fleece and the shape of the body; those animals, a combination of the qualities of which seemed to be desirable, being thus mated to produce a new B. In oxen the quality of the flesh and milk, and in horses the form and stamina or enduring power, have respectively formed chief ideas in the guidance of the breeder. In a wild state breeds are produced, as between certain game-birds, and between wild cattle, deer, &c.; and in wild and domesticated animals, it is frequently impossible to determine the original stock or progenitors of the numerous derived races. See also HYBRID SPECIES, HORSE, OX, &c.

Bree'de, a river flowing in a S.E. direction through the district of Zwillingdam, Cape Colony, and entering St Sebastian's Bay, or Port Beaufort, from which it is navigable for a distance of 40 miles inland.

Bregenz (Lat. *Brigantium*), the capital of the circle of Vorarlberg, in the Tyrol, Austria, near the German and Swiss frontier, at the entrance of the small river B. into the S.E. part of Lake Constance, called *Bregenzer See*. It is an old town, with good railway communication, and has a large transit trade, and considerable manufacture of wooden wares. Its wine is celebrated. Near it is the *Bregenzer Klause*, a ravine between the Tyrol of Swabia, at one time having fortifications, which were swept away by the Swedes during the Thirty Years' War (1646), when B. itself was taken. The *Bregenzer Wald* is a well-wooded spur of the Algaü Alps, with a peak (Kanisfluh) 7200 feet high. Pop. of B. (1869) 3451.

Brehon Laws, the ancient laws of Ireland, or Judges' Laws (*Dlíghidh Breitheamhinn*), which Lord Eglinton's Commission of 1852 have been publishing—the first three volumes (1865, 1869, and 1873) being translated by Dr O'Donovan and Mr O'Curry, both of whom are now dead. The third volume contains a valuable preface. What has been published consists of the *Senchus Mor* (Great Book), which claims the authority of St Patrick and Dubhthach, the royal poet of Erin, and is assigned to the end of the 11th c.; and the *Book of Aicill*, or sayings of Cormac and Cennfaeladh, partly written by a retired king, and assigned to the end of the 10th c. There are minor tracts, such as the *Corus Bescna* and the *Crith Gablach*: each text has a commentary and marginal glosses. The Brehons were probably at first, like the Druids, if not a sacred, at least a literary class, having authority to declare the law in matters voluntarily submitted to them. From the influence of literary fosterage, the Brehon acquiring certain rights over the person and property of his pupil, this class would tend to become an hereditary caste. The laws distinguish the law of nature (pre-existing Celtic custom, either adopted or not abolished by St Patrick) and the law of the letter (the Bible as interpreted by the Church). There are traces also of the law having been declared by the chiefs at the triennial fairs. No consistent scheme of the B. L. is as yet possible, but on a variety of points the published volumes are explicit. Temporary cohabitation seems to have been

usual between the sexes, and legitimization of bastards (even adulterine) took place on payment of compensation to the putative parent. There were seven grades of chiefs, distinguished by their wealth in cattle, the importance given to their evidence, the amount of dues received from vassals, the amount of compensation due on injury, and their power of contracting. The *Bo-aire*, or man wealthy in cows, became an *aire-desa*, or inferior chief (*Kaith*). By appropriation of tribal waste-lands, by subordination of *Findhir* (broken men or stranger tenants), and by lending out their surplus stock of cattle to assist in agriculture, these chiefs gradually developed the laws of Jaerstock and Daerstock. In the former the *Ceile* or *Kyle* (tenants) held land for seven years, returning the growth, increase, and milk of the few cattle they received, and rendering also homage and labour in harvest and building. The latter was an oppressive tenancy (the origin of the 'cushering' and 'coign of livery' alluded to by Spenser in 1596), in which the tenant lost status, and gave a rent in kind, the chief having also a right of feasting at his tenant's expense. The *Findhirs* are also called *Senclaithe* and *Bothachs*, and were possibly men excommunicated from their native tribe, and not protected by native institutions. Both tribe and family are called *Fine*, and intermediate is the sept or joint-family. The family, or descendants of a living ancestor, divide into the *Galfine*, *Deirbhfine*, *Yarfine*, and *Indfine*, containing seventeen members. On the birth or adoption of a new member, the senior member for each 'Fine' but the last is promoted to the 'Fine' above, and the seventeenth member leaves the family. The grouping here is radically different from that based on 'degrees,' and now universal. Before the 17th c., when the Anglo-Irish judges established primogeniture, the rules of succession were those of Tanistry as regards the succession of chiefs, and Gavelkind, or rather divisions among the males of the sept, whether bastards or not, according to antiquity, in the case of family property. Latterly the power of disposing of property during the life of the head of the family seems to have been partially recognised, the ancestor becoming a 'pensioner.' Similarly the land, which was at first either tribal or unappropriated, gradually became in the first case subject to division at the end of ten years, or held in severalty under purchase or other contract. The restraints on alienation were relaxed in cases of acquired property, or of necessity, or of poets and judges, or of promises to the Church. 'Rundale' occupation and the duty of uniform tillage survived the tribal occupation. The original monastery and the minor abbots and bishops which sprang up in its neighbourhood also retained a sort of tribal relation, a blood-relative of the founder being preferred to the abbots. The subject dealt with in most detail in the volume of 1865 is the law of distress. The custom of a creditor 'fasting' at the door of his debtor by way of giving notice to pay, resembles the Hindu custom of 'sitting Dharna,' and the Persian custom of sowing barley and sitting at the door. This distress, which proceeded before an agent and witnesses, was entirely free from judicial authority, and extended to all breaches of contract. When the 'dithum,' or stay in the public pound, was exhausted, the pledge was gradually absolutely forfeited according to the amount of the debt. (See Sullivan's *Introduction* to O'Curry's *Manners and Customs of Ancient Ireland*; Mainz's *Lectures on Early Institutions*.) The general result seems to be to reveal a greater similarity between Celtic and archaic Teutonic, and indeed all Aryan civilisation, than has hitherto been admitted.

Breisach Alt (the *Mons Brisiacus* of Cæsar), a very old town in Baden, on the right bank of the Rhine, on a steep basaltic hill, 800 feet above the sea, 12 miles W. of Freiburg. It was once a free imperial town, and until the middle of last century was reckoned one of the strongest fortresses, the very key, in fact, of W. Germany. The minster of St Stephen is remarkable for a beautiful altar-screen of carved wood. Weaving, agriculture, and cattle-rearing are the chief industries pursued by the inhabitants, who number (1872) 3255. The French, into whose hands it came at the close of the Thirty Years' War, destroyed its fortifications in 1744, and they have not since been restored. By the peace of Presburg, B. was ceded to Baden in 1805. See Rosmann and Ens, *Geschichte der Stadt B.* (Freib. 1851).—**Neu B.** (Fr. *Neuf Brisach*), a town and fortress in Upper Alsace, on the Rhine, opposite Alt B., was built by Louis XIV. in 1699, and is one of the strongest military posts in the pro-

vince. It was besieged by the Germans during the Franco-Prussian war, and capitulated 10th November 1870. The place is an octagon in shape, has a pop. (1873) of 2627, and carries on a small trade.

Breit'nfeld, a village of Saxony, a few miles N. of Leipsic, with 177 inhabitants. It is remarkable for three great battles fought in its neighbourhood—(1) that between the Swedes and Saxons, commanded by Gustavus Adolphus, and the Imperialists led by Tilly, September 7, 1631, when the former gained a decisive victory, which established Protestantism in the N., and secured the freedom of Germany; (2) that between the Swedes under Torstensson and the Imperialists, led by the Archduke Leopold and Piccolomini, October 23, 1642, in which the Swedes were again victorious. The Imperialists lost the greater part of their artillery and standards, and all their baggage. (3) One of the great group of battles between the Allies and Napoleon at Leipsic, 10th October 1813.

Bre'men, a free city of Germany, next to Hamburg the greatest of German ports, and the chief emporium of the American trade, lies on the Weser, 50 miles from its entrance into the North Sea. It is divided into three parts—Old B., New B., and a suburb surrounded by the river, which separates into the large and little Weser before reaching the town, and which on leaving it reunites. Communication is kept up by means of three bridges, one of which was completed in 1875. The chief public buildings are the cathedral, founded in 1050; the Church of Ansarius (1229), supporting a tower 370 feet high; the Gothic town-hall (1410), with its arcade, statues, and celebrated wine-cellars; the old guild-house (*Schütting*); the exchange, the museum, and the observatory (1856), long under the care of the famous Dr Olbers. B. has thirty high schools, with 3841 pupils and 249 teachers; and twenty-four free schools with 7782 pupils and 199 teachers, besides many technical schools and a public library of 20,000 vols. The city was formerly surrounded by fortifications, and these have now given place to beautiful promenades. Many improvements have been recently made, including the erection of the new city waterworks (1872), also of an imperial post-office (1873), and of an extensive railway terminus (1875), the last being required by the opening of three additional lines connecting B. more directly with Berlin, Hamburg, and the S. of Germany. Owing to its isolated position as a free city, B. is deprived of the privileges of the German customs union, and its industries have therefore somewhat declined, although its trade is rapidly increasing. There are manufactures of soap, sailcloth, and asphalt, besides which there are 201 tobacco and cigar manufactories, producing cigars to the value of some £1,120,000 yearly; three sugar-refineries, several distilleries and rice-shelling mills, fourteen engineering works and iron-foundries, and shipbuilding yards (chiefly at Bremerhaven—q. v.) employing about 1000 men. Trade is chiefly carried on with United States, Great Britain, S. America, W. India, and Burmah; and the imports are cotton, tobacco, wool, silk, coffee, rice, indigo, hops, coals, and petroleum; exports, woollen and cotton goods, iron and steel wares, cigars, books, ribbons, musical instruments, and toys. In 1874, 3407 vessels of 990,101 tons entered the port, and 3243 of 903,015 tons cleared; while the imports (1873) amounted to £26,270,500, and the exports to £20,381,900. The number of ships belonging to the port was (1875) 226, of 176,115 tons. B. was long the chief Continental port for emigration, the number of emigrants being (1872) 80,212, (1874) 30,636; it is now, however, surpassed by Hamburg in this respect. There is a large river trade at B. itself, but the harbour is only seven feet deep, and most of the shipping is carried on at Bremerhaven. Pop. (1873) 88,146. In the reign of Charlemagne, B. was made the see of a bishop, and in later times it became a leading Hanse town. The French captured it in 1810, but it regained its freedom in 1813, and two years later it was attached by the Congress of Vienna as a Hanse town to the German Confederation. It is now a portion of the German empire, always preserving its separate governmental existence.—The small republic of B. has an area of some 100 sq. miles, and a pop. (1873) of 130,871. The government, by Constitution of 21st February 1854, consists of a senate and municipal council. The first comprises eighteen members, of whom two are burgomasters; and the latter 150, elected for six years. In 1871 the revenue was £1,767,473, and expenditure £2,678,286; while the public debt

was £1,965,139. Besides the capital, B., the towns Bremerhaven and Vegesach belong to the republic. See Roller's *Geschichte der Stadt B.* (4 vols. Brem. 1799-1804); Buchenan, *Die Freie Hansestadt B. und ihr Gebiet* (Brem. 1862); and the *Bremischer Jahr-Buch* (5 vols. 1864-70).

Bre'mer, Fredrika, an eminent Swedish novelist, was born, 17th August 1801, at Tuorla, near Abo, Finland, whence she was taken, at the age of three years, to Stockholm. There her novels first appeared in 1835. She visited England, Germany, and America, and embodied her recollections of the last country in her *Homes of the New World*. She died 31st December 1865. Several of her works have been translated into English by Mrs Howitt—among others, *The Neighbours*, *The Midnight Sun*, *Life in Dalcarlia*. Her writings are distinguished by sound judgment, keen knowledge of character, a terse and lucid style, and delicacy and vividness of description. They have become widely and deservedly popular throughout Europe. The collected editions of her works in Swedish are the *Tekningar ur Hvardagslivet* (7 vols. Stockh. 1835-43), and its supplement, *Nya Tekningar*, shortly after. But the only complete edition is in German (*Gesammelte Schriften*, vols. 1-50; Leips. 1857-63). See *Frederika B.'s Lebenschilderung und nachgelassene Schriften* (2 vols. Leips. 1868), published by her sister, Charlotte Quiding.

Bremerhaven ('haven of Bremen'), a seaport at the mouth of the Weser, on its right bank, 32 miles N.N.W. of Bremen by rail, has shipbuilding yards and two harbours, of which one, constructed 1847-66, can admit the largest war-ships. B., which is protected by Fort Wilhelm, occupies a site bought by Bremen from Hanover (1827) for £23,798. In 1871 there entered the port 1255 vessels of 1,254,302 tons. Pop. (1873) 10,596. B. has an 'emigrants' house' for 3000 persons.

Brenner, a mountain in the Tyrolean Alps, between Innsbruck and Sterzing, 6853 feet high, crossed by the lowest of the great Alpine passes at an altitude of 4609 feet. The pass is available at all seasons, and on its summit are the village of B. and the B. Lake, where the Eisach, a feeder of the Adige, and the Sill, an affluent of the Inn, take their rise. It is crossed by a railway, completed in 1867, by which the trade between Venice and S. Germany and Austria is greatly facilitated.

Brennus (probably the Cymr. *Brenhin*, 'a king'), the title of the leader of the Horde of Senonian Gauls who in 390 B.C. crossed the Apennines and inflicted a signal defeat on the Romans at the rivulet of the Allia. His troops gave themselves up to cruel and senseless mutilation of the slaughtered Romans, to drunkenness and sleep, and it was not till the third day that he entered Rome. Meanwhile the Capitol had been secured, and B. wreaked his vengeance on the aged patricians, whom he found resolved on not surviving the destruction of the city. The Capitol stood a siege of six months, when B. and his forces agreed to be bought off for 1000 lbs. of gold. With this booty, according to Polybius, they returned to Gaul. Livy, however, adopting what Mommsen calls 'a legend of late and wretched invention,' represents them as having been entirely cut off by Camillus, who suddenly appeared at the head of an army just as the gold was being weighed.—Another B. was the leader of the descendants of those Gauls who (according to Livy) had recrossed the Rhine, marched eastward, and settled in Pannonia on the Middle Danube. In 279 he made a double irruption into Greece during the absence of Pyrrhus, ravaging Macedonia and Thessaly, and finally marched upon Delphi to plunder its wealthy shrine. The Delphians, strongly posted, withstood him with 4000 men; the host of B. was routed, and himself wounded. He might have escaped; but Pausanias says that, resolving not to survive his shame, he quaffed strong wine so copiously as to bring about his death.

Brenta (the *Medoacus Major* of the Romans), a river of N. Italy, has its sources in Lake Caldonazzo, near Trent, in the Tyrol, and enters the Venetian territory at Primolano. Below Padua it becomes navigable, and falls into the sea at Brondolo. Long ago the Venetians, to preserve their lagoons from being silted up by the floods of the B., cut a channel (*B. Nuovissima*), to distinguish it from a previously cut *B. Nuova* which considerably relieved the bed of the river. The original bed of the

B. was then used as a canal, *Naviglio di Brenta morta or magra*, and still forms the water communication between Venice and Padua.

Brenta'no, Clemens, a dramatic poet and novelist, belonging to the Romantic school, was born at Frankfurt-on-the-Main, 9th September 1778. He studied at Jena, and after a restless, changeable, and morbid life, died at Aschaffenburg, 28th July 1842. B. had a fine satiric faculty. His *Lustige Musikanten* ('Merry Musicians,' Frankf. 1803) and *Ponce de Leon* (Gött. 1804) display great dramatic power and brilliant wit; while his *Geschichte vom Braven Kaspar und dem schönen Annerl* (2d ed. Berl. 1851) is an admirable specimen of the novel 'in little.' His last work, *Gokel, Hinkel, und Gakelein* (Frankf. 1838), delineates the follies of his own time with mocking irony. He was so dissatisfied with a collection of poems which he had published at Hamburg in 1819, under the title *Schnitzglückchen*, that he bought back the copies for the purpose of destroying them. Some tales and poems of his were posthumously published. As the brother of Goethe's Bettina von Arnim, he has a double chance of being remembered.

Brentford, a market-town of Middlesex, at the junction of the Brent with the Thames, 7 miles W.S.W. of London. It is a station on a loop-line of the London and Southampton Railway, and is connected with the Great Western by a small branch line. B. consists chiefly of one long, narrow street, has soap factories, sawmills, large gas and water works, and extensive market-gardens. Pop. (1871) 11,091. B. is a very ancient place. Here, in 1016, Ironside defeated the Danes; and in 1642 the Royalists defeated the Parliamentary forces under Colonel Hollis.

Brent Goose. See BARNACLE GOOSE.

Brescia (anc. *Brixia*), the capital of a province of the same name, N. Italy, picturesquely situated on the rivers Mella and Garza, 60 miles E.N.E. of Milan, on the Milan and Verona Railway. It has manufactures of woollens, silks, leather, paper, and oil, is noted for its wine (*Vino Santo*), and is the site of a great silk fair. It contains an old and a new cathedral, the former belonging to the 9th c., the latter built 1661, 1824, and containing many beautiful paintings. There are numerous Roman remains, the most complete of which is the so-called Temple of Hercules, excavated in 1820, and now forming a museum of antiquities. B. has a fine public library (*Biblioteca Quiriniana*), containing 35,000 volumes and many valuable manuscripts, founded (1750) by Cardinal Quirini. In 1402 the town was almost destroyed by the French. Under Garibaldi in 1848 it resisted the Austrian rule in Lombardy but was taken by Haynau in 1849. Pop. (1871) 38,906.

Breslau (Lat. *Wratislavia*, Pol. *Wrocław* or *Wraciszlaw*, or *Wratidavia*), the capital of the Prussian province of Silesia, the third residence of the court, and, next to Berlin, the largest city in the monarchy, is situated at the confluence of the Oder and Ohlau, 140 miles E. of Dresden, and 195 S.E. of Berlin. It is divided by the Oder into the old and new town, connected by many fine bridges, and has, in addition, five large suburbs. It contains many beautiful buildings, and of the numerous handsome squares, the chief is the Great Ring, containing the old town-house, built in the 14th c., the new one erected in 1863, the equestrian statue of Friedrich the Great (1842) by Kiss, and that of Friedrich Wilhelm III., unveiled in 1861. The two principal churches are the Cathedral of St Mary's (1288), and the Protestant Church of St Elizabeth, with a tower 364 feet high. B. has a university, founded in 1702, with about 1000 students, and a free library of 300,000 volumes; also a medical school, five gymnasia, and several Protestant colleges. It has five railway stations, and is the centre of the Silesian trade, having great wool and cattle markets. There are also important manufactures, chiefly in woollens, cottons, linens, lace, silks, spirits, machinery, jewelry, and earthenware. B. is not mentioned earlier than 1018, and is of Slavic origin. It was the capital of an independent duchy (1163-1335), afterwards a member of the Hanse League, and a free imperial city; and finally, in 1741, was wrested from Austria, along with the rest of Silesia, by Friedrich the Great. Here the peace between Prussia and Austria was signed, June 11, 1742. The Austrians recovered B., November 22, 1757, but it was retaken by Friedrich a month afterwards. It capitulated

to the French in 1807. In 1813 it was dismantled, and its fortifications were converted into beautiful promenades. Pop. (1871) 207,997, of whom upwards of 45,000 are Roman Catholics and 11,000 Jews. See S. B. Klose's *Documentirte Geschichte und Beschreibung der Stadt B.* (5 vols. Bresl. 1780-83), and Luch's *Führer durch B.* (3d ed. Bresl. 1863).

Bressay, one of the Shetland Islands, about 5 miles long and 3 broad, separated from Lerwick by B. Sound, one of the best natural harbours in the world, being almost enclosed by land. At its northern entrance is a dangerous sunken rock, called the Unicorn. The pop. of B. in 1871 was 878, chiefly engaged in fishing or in exporting slates. To the E. of B. is a precipitous and rocky isle, called the Noss, 6 miles in circumference, and rising to nearly 600 feet, with a pop. of 24. The Noss is connected with B. by a rope-bridge.

Brest, a seaport of France, department of Finistère, possessing one of the best harbours in Europe, lies on the N. side of the landlocked Road or Bay of B., which communicates with the sea by the strongly-defended channel of *Le Goulet*. It is a fortress of the first rank, and the greatest naval station of France. The town is on a very uneven site, and is divided into two parts by the Penfeld, at the mouth of which is situated a castle, anciently the residence of the Dukes of Bretagne. The principal buildings are the Church of St Louis, begun in the 17th c., a splendid marine hospital, a fine new theatre, and a town library with 25,000 volumes. A new floating dock, quays, and pier were completed in 1876 at a cost of 22,500,000 francs. B. has extensive shipbuilding yards, storehouses, and barracks, handsome quays, and excellent schools of instruction in navigation and marine engineering. Since 1867 B. has had telegraphic communication with America by means of a submarine cable. The total number of vessels that entered the port in 1874 was 1499 of 88,886 tons, and that cleared, 1518 of 87,371 tons; while the total value of imports was £644,474; of exports, £395,963. At the 31st of December 1873 B. had belonging to her own port 187 vessels (4799 tons), of which the great part are engaged in coasting and fishing. Pop. (1872) 50,833. B. is a town of considerable antiquity, but it only rose to importance in the 17th c. It was strongly fortified by Vauban in 1680. The English fleet under Admiral Howe gained a complete victory here over the French, June 1, 1794.

Bretagne or **Brittany**, at different times a kingdom, dukedom, and province of France, included a territory (now represented by the departments of Finistère, Côtes-du-Nord, Morbihan, Loire-Inférieure, and Ile-et-Vilaine) forming the N.W. angle of the country, and bounded on the N.W., W., and N. by the Atlantic and English Channel. At the time of Caesar's invasion B. formed a part of the maritime district of Armorica, and the names of the principal Celtic tribes who inhabited this district—the Veneti, Redones, and Nannetes—are preserved in the names of the Breton towns Vannes, Redon, and Nantes. Under the Romans, whose authority, however, was only partial, it was called *Provincia Lugdunensis*. After the 4th c. it appears as the head of an Armorican confederation of republican states. Soon after kings appear. In 497 the country was conquered by the Frankish King Chlodwig. The Franks now began to call the inhabitants *Brettons*, as indeed the Latin writers of the 5th c. had already done. These speak of *Britanni* and *Brittones*, and designate the land *Britannia Cismarina* (later, *Britannia Minor*), in contradistinction to the island of Britain across the Channel, and also in allusion to the common Celtic ancestry of both peoples. The Frankish lordship was reasserted by Charlemagne and his successors. Meanwhile, though B. was sometimes ruled by native princes who called themselves kings (c.p., 824-874), the title at last became extinct, and the country was divided into a number of counties, as Rennes, Vannes, Cornouaille (Cornwall), &c. The suzerainty of B. passed to the Normans in 912. B. became a separate dukedom under Geoffroi, Count of Rennes, in 992. In the middle of the 12th c., the succession to the throne was disputed, but by the marriage of Constance, daughter of one of the claimants, to Geoffrey, son of Henry II. of England, B. passed for a time into the possession of the house of Plantagenet; but on the death of Prince Arthur, in 1203, Normandy was confiscated by the French king, and B. passed with it under the

French crown. It passed in 1213 to Pierre Mauclerc, Comte de Dreux, who had married a daughter of Constance. Claude, daughter of the last Duchess of B., married the Duke d'Angoulême, who ascended the French throne as François I. in 1515. By the articles of marriage Claude ceded her rights to B. to her husband, and the ancient dukedom was formally incorporated with France as a province in 1532. See Daru's *Histoire de B.* (3 vols. Par. 1826); Roujoux's *Histoire des Rois et des Ducs de B.* (2 vols. Par. 1829); De Courson's *La B. du 5^{me} au 1^{er}me Siècle* (Par. 1863).

The Breton (*Breizounek*) language belongs to the Celtic family, and, along with Cornish and Welsh, forms the Cymric (*Cymraeg*) branch. It gradually received Romance elements; and after the incorporation of B. with France, it was greatly changed, and in Upper B. completely suppressed. In Lower B., on the other hand, it has maintained its existence till the present day, in different dialects, of which those of Vannes, Cornouaille, Tréguier, Léon, and St Brieuc are the most important. About 1,200,000 people in the province use one or other of these, and are known, in contradistinction to the French-speaking population, as *Bretons Bretonnants*. They inhabit the departments of Morbihan, Finistère, and Côtes-du-Nord.

The Breton literature in its earliest stage (from the 5th to the 12th c.) may be said to be identical with that of the *Cymraeg* of Wales. The works of the 'bards' belong to both sides of the Channel, and several of them are believed, at least by German and French critics, to have originated in B. rather than in Wales. But after the 12th c., when Normans, Anglo-Normans, and French, more and more extended their authority over the district, and allied themselves with the leading families, the bards gradually found countenance only among the gentry of Lower B., or even as wandering minstrels sought the favour of the common people. Yet the wide sweep of the Arthurian Romance (q. v.) shows that the Breton literature had powerfully influenced the W. of Europe; and although the French tongue made rapid strides among the higher classes, the peasantry clung with singular tenacity to the old tongue of the country, preserving in their hearts and on their lips its ancient songs and legends, and even adding fresh matter to its poetic lore. An admirable collection of these songs was published by Hersart de la Villemarqué (*Barzaz-Breiz*, 2 vols. Par. 1839; new ed. 1846), while the legends have been worked up by Souvestre in his *Foyer Breton* (Par. 1844). More than 150 mystery-plays were composed in the Breton language, and acted and printed in the 16th c. Several priests, too, wrote religious poems and books of instruction for the people. The most celebrated was Michel le Nobletz de Kerodern (1577-1651), whose sermons and songs were received with great enthusiasm. Among his successors, Father Julien Maunoir (1606-83) achieved scarcely less success. Later names in the department of religious poetry are those of Marzin, Delrio, and Lannion; while Gregoire of Rostrennan, Le Pelletier, but, above all, Le Gonidec (died 1838), have done good service to the study of the language by their lexicons and grammars. The last has given us the best Breton grammar (Par. 1807; 3d ed., by Villemarqué, 1850), and the best Breton dictionary (Angoul. 1821; 3d ed., by Villemarqué, Par. 1847). He also published a series of translations, including one of the entire Bible, into Breton (1827). Since his time, not only have the earliest literary monuments of the country been collected and published, but journals have been started, and a crowd of poets and *littérateurs* have come forward using the native tongue. Ricou, Brizeux, Goesbrand Laouénou, and the Abbé Elech particularly deserve mention. See the writings of Villemarqué and Souvestre.

Brethren and Sisters of the Free Spirit, a sect in the 13th c., whose original name was the Ortlibenses and Amalricians, assumed their later name from the words of St Paul in Rom. viii. 2, 14. On this ground they claimed freedom from the guilt of sin and outward ordinances; and consequently soon lapsed into fanatical lawlessness and licentiousness. They were dispersed in the 14th c. by persecution.

Brethren of the Common Life, or of Good Will, a Dutch branch of the sect called the 'Friends of God,' was founded by Gerard Groot, of Deventer (1340-84), a canon of Utrecht and Aix, who gave up his ecclesiastical position to devote himself to missionary preaching, by which he excited

great enthusiasm throughout Holland. When prohibited from preaching, he established a theological college in his own house, which was developed after his death into a monastery of regular canons. These were joined by many laymen, who lived together in a community of goods, but without any monastic vow. Within fifty years of Groot's death they numbered seventeen churches in the Netherlands, but the order was extinguished by the Reformation.

Bretign'y, a village in the department of Eure-et-Loire, France, where, on May 8, 1360, a treaty was concluded between England and France, by which Edward III. renounced his claim to the French throne, gave up his possessions in the N. of France and the basin of the Loire, and had his title to Guienne and Gascony made independent of the French king; and Jean II. of France, then a prisoner in England, was released on agreeing to pay a ransom of 3,000,000 crowns. This he was enabled to do by receiving from Galeazzo, Visconti of Milan, 600,000 gold florins for the hand of his daughter Isabelle.

Breton de los Herre'ros, Don Manoel, a popular Spanish poet, was born, 19th December 1800, at Quel, Lagroño. Educated at Madrid, he served in the army (1814-22), and afterwards held several Government appointments. The success of his *A la Veja Viruelas*, a comedy in three acts, represented 24th October 1824, determined his career. During the next eleven years he produced 120 dramatic pieces—a fecundity intelligible when it is known that many of these were adaptations of old Spanish plays, or translations from the French and Italian. A recent production, *La Desvergüenza* (Mad. 1858), is a poem of great length and full of humour. B. was elected a member of the Royal Academy of Spain in 1837. A collection of his works, in 5 vols., revised by himself, appeared at Madrid (1850-52). His rich comic vein and his causticity are not more remarkable than the easy harmony of his style. He died November 1873.

Bretschneider, Heinrich Gottfried, a German satirist, born at Gera, 6th March 1739, and educated at the Hernalster Institute at Elbersdorf, and afterwards at Gera. During the Seven Years' War he entered the Prussian army, was taken prisoner by the French at the battle of Kolin, and retained in a French fortress till the peace of Hubertsburg in 1763. He afterwards travelled in England and France, was librarian to the University of Ofen in 1778, incurred there the enmity of the Jesuits, though befriended by Joseph II., and, after several changes of position and residence, died at Krzimiz, near Pilsen, in Bohemia, 1st November 1810. His *Almanach der Heiligen auf das Jahr 1788* is a trenchant attack on priests and monks. He had previously, in 1774, attacked Wertherism, then rampant in Germany, in his *Eine Entsetzliche Mordgeschichte von dem Jungen Werther*. He is said to have furnished Nicolai materials for his *Voyages*.

Bretschneider, Karl Gottlieb, a German theologian, born at Gersdorf, Saxony, 11th February 1776, and educated at Chemnitz and Leipsic. In 1807 he was appointed chief pastor at Schneeberg; in 1816 superintendent-general at Gotha, and in 1840 Upper Consistorial Councillor. He died 22d January 1848. B.'s writings still maintain their place in German theology from their learning and impartiality. The *Handbuch der Dogmatik der Evan. Luth. Kirche* (2 vols. Leips. 1814-18), *Lexicon Manuale Græco-Latinum in Libros N. Testamenti* (Leips. 1824 and 1840), and *Corpus Reformatorum* (vols. i.-xv. Leips. 1834-38), are among his more important contributions to theological literature.

Brett'en, a town of Baden, 13 miles E. from Karlsruhe, interesting as the birthplace of Melancthon. Pop. 3352.

Breughel, Pieter, the head of a famous family of Dutch painters, born at Breughel, near Breda, was a clever painter of rural life (hence his name, 'Peasant B.'). His works are distinguished for truth and for vivid colour. Of his birth and death the dates remain unfixed, but he flourished between the first and last quarters of the 16th c.—Pieter B., the younger, his son, known also by the surprising *sobriquet* of 'Hellish B.' on account of the fiends, witches, and robbers who figure in his works, died in 1625.—Jan B. ('Flower B.'), born at Brussels in 1568, was distinguished in landscape and in small figure subjects, and died at Antwerp, 1625. He painted the landscapes

for the works 'Adam and Eve in Paradise' and 'Vertumnus and Bellona,' in concert with Rubens, who supplied the figures.—Other members of the family were Abraham, Jan Baptist, and Gaspar B., painters chiefly of fruit and flower pieces.

Bre've, the longest note used in old musical notation, written commonly |C|. It is not now used, except in *Alla B.* (q. v.), or *Alla capella* movements.

Breve. See ANT-CATCHER.

Brevet' is a commission in the army conferring rank above that for which the officer receives pay. In former times, B. promotions were made about once in six years, or upon very special occasions of national rejoicing, such as the ending of a war or a coronation. But general brevets are now abolished, some particular promotions by B. being, however, retained. A lieutenant-colonel by five years' service obtains the rank of colonel, but without increase of pay. Lieutenant-colonels, majors, and captains may obtain B. rank for distinguished services in the field, the promotion carrying relative increase of pay, except as regards the lieutenant-colonels. B. rank does not affect the position in a regiment, but is of importance in this respect, that colonels rise by seniority alone to be general officers, and, except in the artillery and in the engineers, colonel is a B. rank only. In the navy there is no B. rank.

Breviary (Lat. *breviarium*, from *breve*, short, and *orarium* (?), a collection of prayers) is a collection of the Psalms, Lessons, Prayers, and Hymns which form the daily offices of divine service, as distinct from the Liturgy. The books from which the B. was compiled were—(1) The *Psalter*, including the Psalms of David, the Te Deum, Athanasian Creed, &c. (2) The *Antiphonarium*, a collection of short sentences, chiefly taken from the Bible, sung before or after a psalm or canticle as a keynote to its application. (3) The *Hymnarium*, or hymnal. (4) The *Collectarium*, a book of collects or short prayers to be offered by the priest in behalf of the people. (5) The *Homiliarium*, a collection of homilies or religious addresses, founded on passages of Scripture, by the most eminent of the Fathers. (6) The *Passionarium* and *Martyrologium*, which were books of the acts and sufferings of martyrs, to be read on their anniversary days in the churches where they were buried. The B. was perhaps introduced about the 6th c., when St Benedict condensed the daily offices for his rule; the name was in common use in the time of Micrologus, who wrote a treatise on the service of the Mass about 1080. There have been a great variety of breviaries, but they may all be reduced to four principal classes: the Roman, the Gallic, the Mozarabic or Old Spanish, and the Anglican.

Breviling'ua, the name applied to those *Iacertilia*, or Lizards (q. v.), in which the tongue is thick, fleshy, and protrusible, or capable of being protruded only when the mouth is open. This name is used in opposition to the term *Fissiling'ua*, which denotes those lizards in which the tongue is bifid or cleft or sheathed, and capable of protrusion through a notch in front of the jaws, even when the mouth is closed. The B. (or *Pachyglossa*) are represented by the geckos, iguanas, &c.

Brevipenna'tæ. See BRACHYPTERES.

Brewing. See BEER.

Brewing (in law). Instead of a licence to brew being now required, as formerly, duties are levied on the quantity brewed. The brewer must make specified entries at the nearest excise office. The penalty for omission is £200, with forfeiture of implements and materials. Officers may enter any place used for B. at any time, in order to inspect. The penalty for obstructing an officer in so doing is £100.

Brewster, Sir David, LL.D., D.C.L., F.R.S., &c., one of the greatest physicists of this century, was born at Jedburgh, December 11, 1781, and entered Edinburgh University in 1793 with the design of becoming a clergyman. Though he completed his course, and even made an effort to obtain a charge, his tastes lay in the direction of science, to which he dedicated a long and valuable life. In 1807 he was an unsuccessful candidate for the chair of Mathematics in St Andrews; but in the same year was made LL.D. of Aberdeen, M.A. of Cambridge, and a member of the Royal Society of Edinburgh. Soon after, he commenced the publication of the *Edinburgh Encyclopædia*, a work completed in 1830. In 1811 B. invented his 'polyzonal

lens,' which, notwithstanding its superiority to the old parabolic reflectors, was not introduced into our lighthouses till 1835. He took an early and abiding interest in the British Association, of which he was President in 1850. Knighted in 1832, he received the Prussian Order of Merit in 1847, was elected a foreign Associate of the Institute of France in 1849, and appointed Principal of Edinburgh University in 1860, which post, together with that of President of the Royal Society of Edinburgh, he held at his death, February 10, 1868. B.'s most popular inventions are the kaleidoscope and the lenticular stereoscope. Of his numerous memoirs, we may mention those *On the Depolarisation of Light* (1813), *On the Polarisation of Light by Reflection* (1815), *On the Production of Polarising Structure in all Substances by Pressure* (1816), *On the Laws of Polarisation and Double Refraction in all Regularly Crystallised Bodies* (1818), *On Elliptical Polarisation* (1830). Besides these, he wrote treatises on the *Kaleidoscope* (1819) and on *Optics* (1831), Lives of Euler, Newton, Galileo, Tycho Brahe, and Kepler, *Letters on Natural Magic* (1831), and *More Worlds than One* (1854). His last memoir, which he left unfinished, was *On the Motion, Equilibrium, and Forms of Liquid Films*. See *Home Life of Sir David B.*, by his daughter, Mrs Gordon (Edinb. 1869).

Brewster, William, the leader of the *Mayflower* Pilgrims, was born at Scrooby, 1566, and educated at Cambridge. He left the Established Church, and founded a separate society in his house. In 1608 he went to Holland, and opened a school at Leyden. He was made ruling elder, and conducted the Pilgrims in the *Mayflower* to Plymouth, Mass., in 1620. B. was their only spiritual teacher for some years, but he did not administer the sacraments. He died April 16, 1644, and is venerated as the ruling spirit in the earliest New England colony.

Brexia'ceæ, a small order of Dicotyledonous plants, principally natives of Madagascar. There are in all about six species, belonging to the genera *Brexia*, *Ixerba*, *Rousseæ*, and *Argophyllum*; if they possess any use or property, it is unknown. By some botanists they are included among the Saxifragaceæ.

Brez'o'wa, a market-town in the county of Neutra, Hungary, on the northern slope of the Carpathian mountains, 20 miles N.W. of Leopoldstadt. It is noted for its manufacture of leather, which is in request all over the Austro-Hungarian empire. Pop. (1869) 5886.

Brian Boroi'h'me (pronounced *borà*), an Irish king who held his court at Kincora, near Killaloe, during the early part of the 10th c. After repeatedly defeating the Danes, he dealt them a blow in the battle of Clontarf, in 1014, which irretrievably crippled their power in Ireland, but in which he himself was slain. He was surnamed *Boroi'h'me* (i.e., 'tax') from imposing a tribute on his subject provinces.

Brian'gon (Lat. *Brigantium*), a strongly fortified town in the department of Hautes-Alpes, France, on the Durance, 42 miles S.E. of Grenoble, and commanding the road to Turin by the Mont Genève pass. It is 4300 feet above the sea, being the highest town in France, and has some export trade in talc and cutlery. B. is a fortress of the first rank, the great arsenal and entrepôt of the French Alps, and its approaches are defended by seven forts and many redoubts. Pop. (1872) 1465; with garrison, 3698.

Briansk', a town in the government of Orel, Russia, on the right bank of the Desna, 70 miles W. of Orel, with an imperial building-yard and cannon-foundry. It is surrounded by earthen fortifications, and is a depôt for the Black Sea trade. The exports are chiefly grain, hemp, and iron. Pop. 13,881.

Briare', a town of France, department of Loiret, on the right bank of the Loire, with some trade, chiefly in wine and wood. It is said to occupy the site of the ancient *Brivodurum*. The *Canal de B.* connects the Loire and Seine, and is the oldest canal in France, having been partly constructed by Sully, and completed in 1642. Pop. (1872) 3799.

Bri'bery is the giving, offering, or taking of a reward, so as to influence him who takes it in the discharge of his duty. The offence becomes especially heinous when it affects, or is intended to affect, the administration of justice. Happily in England this phase of the offence is almost unknown. We may the more

congratulate ourselves upon the purity of our Legislature as regards B., as the reverse was the case in comparatively recent years. In 1707 Sir Robert Walpole was appointed Secretary at War, and in 1709 Treasurer of the Navy. In 1712 he was found guilty by the House of Commons of 'breach of trust and notorious corruption,' for which he was expelled from the House and sent to the Tower. Regardless of this early lesson, the great minister continued to bribe members of the House of Commons wholesale to the end of his political career. We remember his cynical dictum, that while one man was unquestionably more virtuous than another, this only meant that he required a larger bribe than the other, and that 'all are to be bought;' but, as Macaulay says, 'We might as well accuse the poor Lowland farmers who paid black-mail to Rob Roy of corrupting the virtue of the Highlanders, as accuse Sir Robert Walpole of corrupting the virtue of Parliament.' But our satisfaction at the happy change in the morality of our House of Commons is diminished when we find that the avenue which leads to it is still often darkly stained with corruption, in which candidate and constituent are found to be participant. As respects the former, doubtless it is often difficult for him, with the purest intentions, to avoid contamination: agents must be employed, for whose acts the law holds him responsible; and the meshes of the law itself are often so contrived that in the hands of a scrupulous and subtle-minded judge it often requires the utmost wariness on the part of a candidate to avoid being caught in them. What constitutes B. is plainly a question to which no definite answer can be given. Each case must largely depend on its own circumstances. Thus, a proprietor of land who concedes to his tenants a right to shoot hares and rabbits before a dissolution of Parliament is announced may be held immaculate as a candidate; but a proprietor conceding the same right after the dissolution has been found, by so doing, guilty of B. The immense sums generally spent on elections testify to the prevalence of this disease of our representative system—a disease from which Scotland is almost free. B. at an election for Parliament is an offence at common law, punishable by fine and imprisonment; and Parliament has at various times endeavoured by statute to strengthen the power of the law. The Corrupt Practices Prevention Act of 1854 inflicts penalties on bribing, treating, and undue influence. Its provisions are most stringent. Under the Corrupt Practices (Municipal Elections) Act, 1872, B. at a municipal election is severely punishable. By the Customs' Consolidation Act, the bribing or corrupting of any officer of customs or excise makes the offender liable to a fine of £200.

Brick is clay moulded into suitable forms, either with or without mixture with other ingredients, and dried. It was one of the very earliest materials used in building. Bricks dried in the sun seem to have been used at first in Egypt, Assyria, and other Eastern countries, but in the ruins of Babylon kiln-burnt bricks have also been found in plenty. The author of Genesis xi. seems also to have been familiar with them. The Romans carried the art of building in B. to great perfection, as is abundantly evidenced by the remains of some of their erections, and they introduced it into this country. Their bricks differed in form altogether from those at present in use, which first appear about 500 years ago.

The clays of this country are very numerous. They are chemical compounds of silicates of alumina, either alone or with silicates of potash, lime, iron, &c. Clay and sand mechanically mixed, as they often occur, are called *loams*, and clay and carbonate of lime, *marls*. The simplest clays—those composed almost entirely of silicates of alumina—are almost infusible, and are known as fire-clays. Of these, the Stourbridge Clay, occurring beneath the coal, is one of the most famous. The clays containing the other oxides mentioned above are less refractory. Ferric oxide seems to add to the strength and hardness of bricks, and it gives them in burning various colours, from red to blue-black, according to the proportion in which it exists in the clay. Clays containing lime and no iron burn white, and require less heat than any other kind to harden them. The bricks made from them are not, however, so strong or durable.

Every kind of clay has the property of absorbing water and forming a paste with it: this can be dried by long exposure to a high temperature, and the mass then shrinks and hardens. The purer the clay the more it shrinks, cracks, and warps in drying, for which reason the best clays cannot be used alone, but are mixed with sand, 'breeze,' or some other material which will counteract this.

The method of making bricks varies very much in different parts of the country, but the following will give a general idea of the process. The clay is dug in autumn (this is called 'clay-getting'), heaped on a level place some feet thick, and left to disintegrate during the winter ('weathering'). In April it is turned over and 'tempered,' either by spade or in a 'pug-mill.' 'Tempering' consists in bringing the clay (mixed, if necessary, with any of the materials mentioned above) to a homogeneous paste. Sometimes it is necessary to grind the clay under rollers about this stage of the process, to make it thoroughly fit for the moulding, the next operation. This used to be done by hand, one B. at a time; but the demand for bricks has increased so rapidly, that machines are now constantly used for that purpose. A machine will mould bricks at the rate of twenty or thirty per minute. The bricks are then air-dried in 'stacks' for a considerable period, and lastly burnt. The burning is carried on either in *kilns*—which are essentially large open B. chambers with flues underneath them—or in *clamps*, in which the bricks are erected into a huge stack, in which the courses of B. are separated from each other by layers of breeze, which serve as fuel for the operations. For brick-making on a very large scale (as, e.g., the Metropolitan Railway), Hoffman's circular kiln has been employed with great economy and success.

'Marls' or 'Malms' is the name given to the best bricks; 'seconds' are an inferior quality of Malms; Red stock (kiln-burnt) and Grey stock (clamp-burnt) bricks are the kinds commonly used; Place bricks are an inferior kind.

Brickwork.—The principal points in the construction of brickwork are that the different 'courses,' or layers of bricks should have surfaces truly horizontal in both directions; that the face and back of the wall should be accurately 'plumb' (unless specially required to have some slope or 'batter'); that as few half-bricks or 'bats' as possible should be used; that the vertical joints of two consecutive courses should as seldom as possible lie in the same plane; and lastly, that the corresponding vertical joints in different courses should be exactly one above the other (this is called 'keeping the perpend').

In order that the wall may have as great lateral stability as possible, it is constructed so that the bricks of each course cover the $\frac{1}{2}$ of the course below;—this arrangement is called bonding, or Breaking Joint (q. v.). Although there are a number of different bonds, only two, the English and the Flemish bonds, are used to any great extent. The former is the stronger and better, and although it is not often used in this country, it is almost universal in Holland and the Low Countries; the latter is considered more ornamental, and is that most commonly used in England, while, oddly enough, it is unknown in the countries from which it takes its name. In English bond the bricks are laid in alternate courses of 'stretchers' (bricks placed lengthways in the face of the wall) and 'headers' (bricks placed lengthways across the wall). In Flemish bond each course consists of alternate stretchers and headers, the stretcher in one course coming over the header in the course below, and *vice versa*. The details of the bonding vary with the thickness of the wall, which again is determined by the dimensions of the bricks used. These are approximately 9 inches long, $4\frac{1}{2}$ inches broad, and about $2\frac{1}{2}$ inches thick; and walls constructed with them are said to be 9-inch, 14-inch, 18-inch walls, &c., according as their thickness is one, one and a half, or two bricks, &c. The thickest walls commonly in use for houses are three-brick walls.

Bricks should be well wetted before they are used, and care should be taken to prevent excess of mortar being put in the horizontal joints, and to secure sufficient mortar in the vertical ones. To prevent the face of a wall absorbing moisture, and to give it a neater appearance, the joints are 'pointed,' that is, the mortar is scraped with a trowel from their outer edges, and its place supplied with cement or hydraulic mortar, both of which are impervious to water. In cases where especially good work is required, bricks are set in cement throughout instead of in mortar. The small B. arches over windows and doors are very frequently set in putty, and constructed of bricks made specially to the form required.

In engineering contracts, quantities of brickwork are commonly stated in cubic yards; for house-work the *rod* is often used as a standard. This is equal to $30\frac{1}{2}$ square yards of a wall one and a half B. thick, or about $11\frac{1}{2}$ cubic yards.

The accompanying illustration is a diamond-shaped frieze in

brickwork from Ratzeburg Cathedral, taken from Lubke's *Ecclesiastical Art in Germany*.

Frieze from Ratzeburg Cathedral.

Bride'well, literally the Well of St Bride, has given name in turn to a palace and a house of correction in Blackfriars, London. The former, built in 1522 by Henry VIII., was gifted in 1553 by Edward VI. to the city of London as a workhouse for the detention and correction of vagrants and disorderly persons. It was placed under the charge of the Lord Mayor and corporation of the city. A new House of Correction has been erected for London in the present reign.

Bridge (Old Eng. *brycg*, Low. Scot. *brig*, Fris. *brigge*, Dut. *brug*, Swed. *brygga*, Ger. *brücke*), a structure for carrying a road or railway across a river, ravine, another road or railway, or any other such impediment to its course. The earliest bridges seem either to have consisted simply of stones or piers, having the spaces between them spanned by large stones or pieces of timber, or else to have been slight platforms carried upon cords of rope or hide, or simply, as in Northern India and elsewhere, suspended cords carrying a cradle in which a man could be conveyed from one side to the other.

Iron Bridge.

Until the era of railways, with its accompanying development of engineering skill and extension of engineering possibilities, the arch remained for centuries the principal and almost the only form in which bridges were built. The arch seems to have been used for the first time in a B. about 127 B.C. in the Senators' Bridge at Rome, constructed by Caius Flavius. Some old writers speak of arched bridges being used by the Chinese long before this date, but there is no reliable information on the subject. For a long time the art of B.-building was kept alive in Europe by the Romans, and from the fall of the empire until the 12th c.—the time of the B.-building Brotherhoods (q. v.)—it made little progress, the only important bridges erected being some built by the Moors in Spain. After this, the art again languished until the beginning of last century, since when it has made rapid and still continued progress. The first iron B. in this country was a cast-iron arch of 100 feet span across the Severn at Coalbrookdale, which was built in 1777. Twenty years later than this, iron suspension bridges of some importance were constructed in America, and during the

early part of this century iron became increasingly used for arches and suspension bridges.

There are three principal types of B.—the arched B., the suspension B., and the girder B. In order that an arch may be stable, its abutments have to be sufficiently strong to resist a great lateral thrust; and, in the same way, 'anchorage' on shore must be provided to resist the pull in the chains or cables of a suspension B. Neither of these structures, therefore, contains within itself the means of resisting the stresses caused by its own weight and the load upon it. The girder, on the other hand, is an *independent* structure, needing no anchorages or abutments, but simply piers strong enough to bear its own weight resting vertically upon them, and has its different members so formed as to resist all the internal stresses just mentioned. Cast-iron girders were early used for small railway bridges, up to 40 feet span; but besides that this was practically the limit up to which such girders could be constructed, cast-iron is a metal eminently unadapted for use in girders. The use of wrought-iron girders made of plates riveted together marks the most important epoch in the history of modern B.-making. Such girders seem to have been employed on a small scale—as joists for flooring—as early as 1832, but the applicability of the system to bridges was not recognised at the time. Under the heading BRITANNIA TUBULAR BRIDGE will be found a statement of the reasons which compelled Robert Stephenson, in designing that structure (the first wrought-iron girder B.), to depart from all precedent, and choose a form previously quite untried. The success of this B. has determined the material and the type of the vast majority of railway bridges since constructed, wrought-iron girders being now almost universally employed. The exact form first adopted by Stephenson has not, however, been found the most advantageous; it is not economical of material, nor does it possess a greater degree of stability than other types. Instead of one great tubular girder, several small 'box-girders' were used, carrying a platform upon which the rails were placed. From this the 'plate-girder' was developed, by the substitution of a single web for the two sides of each of the 'boxes.' The solid web is now generally superseded by a network of Braces (q. v.), some of which are in tension (ties), and some in compression (struts), by which means greater economy of material can be secured. This form of girder is called a 'lattice-girder,' and is frequently used; it seems to have been suggested as early as 1824, and was used in America before our engineers employed it.

The structures of masonry or iron, or both, which support the ends of girders, and support and receive the thrust of arches, are called piers. The use of iron in these piers, and in the substructure of bridges generally, marks almost as great and important a change as its use in the superstructure. Piers may either be (a) altogether of masonry, (b) of masonry or concrete, surrounded with a shell of iron to render their construction more easy; (c) of iron filled up (wholly or partially) with masonry or concrete to give additional stability. Clusters of screw piles are also used as piers in some cases—these are entirely of iron. The principal methods used in excavating foundations for bridges and erecting piers below the water-line are the following:—(a) By enclosing the whole space in a water-tight *coffer-dam* or enclosure, from which water can be pumped, and in which the men can work. (b) By sinking iron cylinders, by dredging the soil from their interior and weighting them with stone or iron. These cylinders form either the pier itself or a permanent casing for it; they are made in lengths, additional lengths being added as the sinking takes place, so as to keep the upper cylinder always above high-water mark. (c) By what is known as the pneumatic method. Here the lower part of the cylinder is converted into an air-tight Caisson (q. v.), and supplied with compressed air by pumps. Men can then work in it, removing boulders, soil, &c., just as in a diving-bell. This method has been used in America for the construction of the foundation of the St Louis B. at a depth of 120 feet below high-water mark, when the men worked under a pressure of 50 lbs. per sq. inch in addition to the pressure of the atmosphere. A day's work under these circumstances was limited to two spells of three-quarters of an hour each.

See also ARCH, BOWSTRING GIRDER, COFFER-DAM, CAISSON, PILES, LATTICE GIRDER, and SUSPENSION BRIDGE.

Bridge-Building Brotherhoods, religious fraternities which originated in the S. of France, and are said to have been

founded by a shepherd, Benezet, afterwards canonised, to whom is attributed the construction of the bridge at Avignon (1176-88). Their objects were to build bridges, maintain ferries, and establish hospices near the most frequented fords and crossings.

Bridge of Allan. See ALLAN.

Bridgeport, a rapidly increasing seaport of Connecticut, U.S., on an arm of Long Island Sound, at the mouth of the Pequonnock, 58 miles N.E. from New York, has manufactures of leather, machinery, sewing-machines, carriages, earthenware, and projectiles. It has also a brisk coasting trade, and engages in the whale fisheries. Pop. (1870) 18,969.

Bridget, St. properly *Birgit* or *Birgitta*, was born in Sweden, of royal blood, about 1302. Having been of a pious disposition all her life, on the death of her husband she divided his property among her eight children, and devoted herself to pious labours. After founding the double monastery of Wastain, she repaired to Rome, where, with visits to other parts of Italy and to Palestine, she spent the rest of her life. She died in 1373, and was buried at Rome, but her body was removed next year to Wastain. She was canonised in 1391, but as this was during the Papal schism, it was thought necessary to have it confirmed in 1415.—**Bridgid**, or **Bride**, a famous Irish saint, was born near Dundalk, 439-453. She was early distinguished for her wisdom, piety, and learning, and became a nun at the age of sixteen or seventeen. After a life spent in acts of piety and charity, including, it is said, many miracles, she died in 525, and was buried at Kildare, where she had founded a monastery.

Bridgeton, a town of New Jersey, U.S., situated on both sides of Cohansey Creek, 48 miles S. of Philadelphia. It possesses upwards of 15,000 tons of shipping, and has manufactures of woollens, iron, glass, nails, &c. Pop. (1870) 6830.

Bridge town, one of the finest towns in the W. Indies, capital of the island of Barbadoes, on the W. coast, in Carlisle Bay. It has been four times destroyed by fire, and once (1780) by hurricane. Pop. 21,384. The Bishop of Barbadoes and the Governor-General of the Windward Islands reside here.

Bridgewater, Francis Egerton, third Duke of, the 'father of British inland navigation,' was born 21st May 1736. With the help of James Brindley, the engineer, he in 1758-61 constructed, under parliamentary powers, the first navigable canal in Britain, which connected his coal measures at Worsley with Manchester, crossing the Mersey and Irwell Navigation by an aqueduct 39 feet above the water, and 200 yards in length. The effect was to reduce by one-half the price of coal in Manchester. He next constructed a canal from Manchester to Runcorn on the Mersey, which, joining the Grand Trunk Navigation at Preston Brook, connects Manchester with Birmingham as well as Liverpool. The Duke and his brother-in-law, the Marquis of Stafford, were the chief promoters of the Grand Trunk. The Duke was remarkable for perseverance and for simplicity of life. He died 8th March 1803. See Phillip's *History of Inland Navigation*.

Bridgewater, Francis Henry Egerton, eighth Earl of, born 11th November 1756, is chiefly to be remembered as the testator who left £8000 to be held at the disposal of the President of the Royal Society of London, to be paid to the person or persons nominated by him who should write, print, and publish 1000 copies of a work on the power, wisdom, and goodness of God, as manifested in the creation. The President, Davies Gilbert, divided the work into eight portions, which he assigned to the gentlemen mentioned in next article. B.'s will was dated 25th February 1825. He died 25th February 1829.

Bridgewater Treatises. These consist of the eight following works, which had at one time great popularity, but which the modern theory of development has tended unduly to discredit:—
1. *The Adaptation of External Nature to the Moral and Intellectual Constitution of Man*, by Rev. Thomas Chalmers, Professor of Divinity, University of Edinburgh (1833). 2. *Chemistry, Meteorology, and the Function of Digestion, considered with Reference to Natural Theology*, by William Prout, M.D. (1834). 3. *On the History, Habits, and Instincts of Animals*, by Rev.

William Kirby (1835). 4. *On Geology and Mineralogy*, by Rev. William Buckland, Professor of Geology, University of Oxford (1837). 5. *The Hand, its Mechanism and Vital Endowments, as Evincing Design*, by Sir Charles Bell (1837). 6. *On the Adaptation of External Nature to the Physical Condition of Man*, by John Kidd, M.D., Regius Professor of Medicine, University of Oxford (1836). 7. *Astronomy and General Physics, considered with Reference to Natural Theology*, by Rev. William Whewell (1839). 8. *On Animal and Vegetable Physiology, considered with Reference to Natural Theology*, by Peter Mark Roget, M.D., Secretary to the Royal Society. A survey of the animal, vegetable, and mineral kingdoms was suggested in the trust deed, and the human hand and the digestive functions were specially mentioned. The authors received each the profits of his own work as well as the sum of £1000. Cheap editions have been issued by Bohn. The line of argument, which is legitimate enough for the purpose of defending natural theology, is one which is now generally repudiated by comparative physiologists.

Bridgman, Laura Dervey, was born in Hanover, New Hampshire, U.S., in 1829. When two years old she lost both sight and hearing, but, under the care of Dr Howe of Boston, acquired the power of reading and speaking with her fingers, and subsequently received instruction in history, geography, and algebra. She has become a skilful teacher of the blind, deaf, and dumb. See *Life and Education of L. B.* (Lond. 1878).

Bridgnorth, a town of Shropshire, on both sides of the Severn, 20 miles S.E. of Shrewsbury, and a station on the Shrewsbury line up the valley of the Severn. Two of its churches are fine, and the town has about twenty exhibitions to Oxford. Pop. (1871) 5876. B. is the seat of a thriving trade in corn, malt, &c. It has large flour-mills and tanneries, manufactures of carpets and rugs, worsted-mills, &c. As its name implies, it was originally a bridge over the Severn, and is a very old town. It has been subjected several times to the horrors of war, being besieged and taken successively by Henry I. and Henry II., the latter of whom almost destroyed its castle, which belonged to the Earls of Shrewsbury. B. was the birthplace of Bishop Percy, and of the less admirable Francis Moore, author of a once famous almanac of the prophetic sort.

Bridgwater, a seaport of Somersetshire, on both banks of the Parret, 12 miles from its entrance into the Bristol Channel, and 30 S.W. of Bristol. The name is said to be a corruption of 'Bridge of Walter,' a Norman follower of the Conqueror, to whom the place was given. B. is certainly a very old town, and formerly had a massive castle, erected in the reign of King John, and dismantled in 1645 by General Fairfax during the civil wars. The Duke of Monmouth was proclaimed king at B. just before the battle of Sedgemoor (1685), and the inhabitants suffered severely at the hands of Judge Jeffreys and Colonel Kirke. The river, here crossed by a bridge, is navigable for vessels of 200 tons, but is subject to a 'bore' or tidal wave, six feet high, by which the shipping is often damaged. B. possessed 154 vessels of 10,140 tons in 1874, and 4686 vessels of 240,437 tons cleared the port. Pop. (1871) 12,101.

Bridlington, or Burlington, a seaport town in the East Riding of Yorkshire, N. of B. Bay, S. of Flamborough Head, and about 40 miles E.N.E. of York. It is a station on the Scarborough, Bridlington, and Hull section of the North-Eastern Railway, and has some export trade in corn, malt, and bones. B. (the name was once written *Brellington*) is very old. There are many traces in the neighbourhood of conflicts between the Danes and the English—tumuli, earthworks, &c. The ruins still exist of a once wealthy priory, founded by a grand-nephew of William the Conqueror. B. is also noted geologically; and in the lacustrine deposits in its vicinity were found the bones of a large extinct elk, whose branching horns measured eleven feet between the extremities.

Bridport, an old town and port of Dorsetshire, situated at the junction of the rivers Asker and Brit or Bride, 2 miles above the entrance of their joint stream into Lyme Bay, 24 miles W. of Dorchester by railway. It has considerable manufactures of twine, cordage, sailcloth, &c., and some shipbuilding. In 1873 there entered the port 69 vessels of 6386 tons, and cleared 36 of 3526. The sandy cliffs near B. present a fertile field for the geologist. Pop. (1871) 7670.

Brief, a word in the practice of the English bar, denoting the summary of his client's case made out by his solicitor for the instruction of counsel. A B. is also any writing issued out of the superior courts commanding something to be done in judicial course. There is also a Church-B., or Queen's Letter, authorising a collection for a special charitable purpose.

Brief or Breve, Papal, is a term used to denote an official communication of the Pope, regarding matters not considered of sufficient importance to require consideration from a conclave of cardinals—such as dispensations, releases from vows, &c. More important matters are disposed of by the Papal Bull. (See BULL.) The B. differs from the Bull in detail of form. The former is dated 'from the day of the Nativity,' and is written in modern Roman character on the smooth side of the parchment. The latter is dated 'from the day of the Incarnation,' and is written in ancient Gothic character on the rough side of the parchment.

Brieg (Slav. 'the ridge'), a thriving commercial town in Prussian Silesia, on the Oder, 27 miles S.E. of Breslau by railway. It has a Church of St Nicholas, built in 1287, four other churches, an old castle, and manufactures of linens, woollens, leather, and tobacco. It has also an active transit trade and important cattle-markets. Pop. (1872) 15,372, of whom 1109 are military. Near B. is the village of Mollwitz (pop. 645), the scene of an important battle, April 10, 1741.

Brielle' (properly *Brede-Hil*), a fortified haven of the Netherlands, province of South Holland, on the island of Voorne, near the mouth of the Maas, 14 miles W. of Rotterdam. It is notable on account of its association with the founding of the Dutch republic and the expulsion of the Spaniards, its capture by William de Marck (1572) being the signal of revolt against Philip II. B. was (1585-1616) one of the towns which formed a security to England for sums advanced to the States. It was also the first town of Holland which in 1813 freed itself from the French yoke without assistance. B. is a town of pilots and fishermen, and has a good harbour. Pop. (1874) 4068.

Brienne' Napoléon, a town in the French department of Aube, situated on the Aube, 19 miles W.N.W. of Troyes. It is formed of two parts, *B.-la-Ville* and *B.-le-Château*, and is a place of great antiquity. The old castle of B. was replaced in the 18th c. by a more imposing building. The town has an educational convent founded by the Minims in 1625, which was transformed in 1776 into one of the twelve military schools of France. Here Napoleon I. received his early training (1779-84) under Pichegru. But B. is chiefly noted as the scene of a bloody conflict between the Prussians under Blücher and Napoleon (29th February 1814), in which the town was almost entirely burned. Pop. (1872) 1850.

Brienzy (*brenitia*, 'thicket' or 'copse'), a town of Switzerland, canton of Bern, at the foot of the Rothhorn, and on the N. shore of the lake of B., to which belong the best of Swiss wood-carvers, and the handsomest of fisher-maids. Pop. (1870) 2605. The lake of B., 8 miles long, 2 broad, and 856 feet above the sea-level, is an expansion of the Aar. In parts it is fully 2000 feet deep. The Giessbach Fall and other picturesque cascades, and the magnificent views to be had from the surrounding mountains, make the lake a favourite resort of tourists, for whose accommodation a steamer plies between B. and Interlaken. The Rothhorn towers above B. to the height of 7710 feet.

Brierly Hill, a market-town and ecclesiastical district in Staffordshire, England, 2 miles N.N.E. of Stourbridge. The district abounds in coal, iron, and fire-clay, and consequently collieries, ironworks, &c., are numerous. Pop. (1871) 11,046.

Briec, St., a seaport and episcopal city, near the mouth of the Gouet, department of Côtes-du-Nord, France, 97 miles N.N.W. of Nantes, and 250 W.S.W. of Paris by railway. Its principal building is a cathedral of the 13th c. The site of the ramparts, demolished in 1788, now forms a charming promenade planted with lime-trees. The town is said to have risen round a monastery built here in the 5th c. It possesses shipbuilding-yards, and has manufactures of linen, woollen stuffs, and leather, and extensive cod and oyster fisheries. Pop. (1872) 10,718.

Brieve, or Breve, is in Scotch law a writing issuing from Chancery (q. v.) in the name of the sovereign, addressed to a

judge, ordering trial to be made by a jury of certain points stated in the B. These writs seem at one time to have been the foundation of almost all civil actions in Scotland; but it is in the appointment of tutors to minors, in inquiries as to lunacy, in ascertainment of Widow's Terce (q. v.), and in dividing property among Heirs-Portioners (q. v.), that brevies are now chiefly in use. There was also the B. of Inquest, the object of which was judicially to ascertain the heir of a deceased person; but for this purpose the form of procedure is now by petition of service. See SERVICE.

Brig.

Brig, the general term for a vessel with two masts, having a boom-mainsail, and otherwise square-rigged.

B. is perhaps an abbreviation of Brigantine (q. v.).

Brigade' (Ital. *brigata*, a company, troop, crew), a military term meaning a temporary grouping of regiments or battalions in the field into one body. Two of these may form an infantry B.; but three or more are quite common. A cavalry B. consists usually of three regiments; but the famous charge of the Light B. in the Crimean war was made by five—the 4th and 13th Light Dragoons, the 8th and 11th Hussars, and the 17th Lancers. The Royal Artillery Regiment (q. v.) is divided into brigades and batteries; a B. usually comprising eight batteries of horse, ten of field, or seven of garrison artillery. The phrase 'Household B.' extends to the Life Guards, the Royal Horse Guards, or Blues, and the Foot Guards. The word B. has acquired a very precise signification by the Army Reorganisation Act of 1872. It consists of two line battalions of the regular infantry, and the militia and volunteers of the B. district. See BATTERY and MILITARY DISTRICT.

Brigade Major, an officer, usually chosen from among the captains on the field, to convey orders, inspect pickets, and keep the Roster (q. v.). He also superintends exercises and evolutions while in discharge of his temporary duties. By the new Army Act of 1872, a B. M. is appointed to each of the three infantry brigades and one to the cavalry brigade permanently associated with the Aldershot military district.

Brigadier-General, or **Brigadier**, a temporary rank in active warfare, in which a colonel or lieutenant-colonel is made a general officer in command of a Brigade (q. v.) for a special service. It is considered a step towards being made a major-general. Each of the three infantry brigades permanently associated with the Aldershot military district by the Army Act of 1872 is commanded by a B.-G.; the cavalry brigade being under a major-general.

Brigandine, a kind of scale-armour, consisting of an assemblage of iron plates sewed upon a quilted linen or leather tunic, and covered with the same material. It was worn by the Brigans—the name of the light troops or skirmishers of the middle ages, derived from the Low Latin *briga*, strife.

Brigantes, the largest of the early British tribes, held nearly all the country between the Humber and Hadrian's Wall, Yorkshire, and the northern English counties. Eboracum (York) was their capital.

Brigantine, a small vessel, partly square-rigged and partly schooner-rigged; from Ital. *brigante*, a pirate, hence originally a piratical cruiser.

Briggs, Henry, a distinguished mathematician, was born at Warleywood, near Halifax, in 1556, and died January 26, 1631, at Oxford, where he had held since 1619 the Savilian chair of Geometry. B.'s great work was his practical improvement upon Napier's system of Logarithms (q. v.). He published in 1624 his *Arithmetica Logarithmica*, and his *Trigonometrica Britannica* was published in 1633 after his death.

Bright, John, a great English politician and orator, was born November 16, 1811, at Greenbank, near Rochdale, Lancashire, where his father, Mr Jacob B., was a cotton-spinner and manufacturer. B. first showed his powers as a speaker by lectures he delivered before a literary institution in Rochdale. The formation of the Anti-Corn Law League, in 1839, brought him into prominence; he joined it, and was soon recognised as the chief orator in it, and, after his friend Cobden, its leading spirit. He entered Parliament in 1843, as member for Durham, his opinions being those of an advanced Liberal and financial reformer. In 1847 he was elected for Manchester, which he represented for nearly ten years. Being rejected in a contest which took place in his absence on the Continent, he was returned in 1857 for Birmingham, and still continues one of its members. Both in Parliament and out of it, B. has been known as the opponent of protection, and the advocate of parliamentary reform. For many years he took a great part in agitations throughout the kingdom for household suffrage, and these may be said to have been crowned with success by the passing of the Reform Act, 1867, forced upon the Conservative Government by the previous action of their opponents. We may mention among the incidents of B.'s parliamentary life, his opposition to the game-laws, his denunciations of the Crimean war, his support of the motion against the second reading of the Conspiracy Bill, which, in 1857, overthrew the Government of Lord Palmerston, his exertions on behalf of the natives of India, and the aid that he gave to the movement which resulted in the disestablishment of the Irish Church. When, after the general election of 1868, Mr Disraeli retired from office, and Mr Gladstone became Premier, B. was appointed President of the Board of Trade. Ill-health, however, compelled him to resign this post, and to retire from active life. Recovering his health, B. was able in 1875 to reappear in Parliament. In the same year he took the chair at the meeting of Liberal members of Parliament which unanimously elected the Marquis of Hartington as successor to Mr Gladstone in the leadership of the Liberal party in the House of Commons. Like his father, he is a member of the Society of Friends, although he has abandoned those peculiarities of speech by which Quakers are usually known. A Selection from the *Speeches on Questions of Public Policy* of B. was published in 2 volumes in 1868, under the editorship of Professor Thorold Rogers. See Robertson's *Life and Times of the Right Hon. J. B.* (Roch. 1878).—**Jacob B.**, a younger brother of B., was for many years one of the representatives of Manchester in Parliament, where he took the management of a bill for the removal of the electoral disabilities of women. He was rejected by Manchester at the general election of 1874, and returned in 1876.

Bright's Disease, a name given somewhat vaguely to any disease of the kidneys, of which the most marked symptoms are albumen and dropsy. It is so named after the distinguished physician who first described it. B. D. is generally applied to an affection of the kidneys, which consists essentially of a disease of the cells lining the tubes of the kidneys, in which these cells become altered, and speedily desquamate, and thus obstruct the tubes. This causes serum and fibrine to be exuded into the urine, and hence when heat is applied to such urine it becomes white and thick, owing to the coagulation of the Albumen (q. v.) contained in it. The urine becomes scanty, of a dark colour, and frequently contains casts of the tubes and cells. On account of the functions of the kidneys not being properly performed, serum is poured into the various cavities of the body and into the cellular tissue, producing local and general dropsy, with a swollen and puffy face. This disease is generally ushered in with shivering, headache, thirst, pain in the small of the back, and vomiting. It may be caused by intemperance, exposure to wet and cold, &c. It frequently follows scarlet fever. Treatment consists in warm clothing or confinement to bed, low diet, plenty of milk, barley-water, &c., poultices or hot fomentations to the loins, with a dose of purgative medicine, as jalap or scammony. After a few days, steel drops, quinine, and other tonics may be given. The above affection is often called *acute B. D.* There is also a *chronic* form of B. D., sometimes called *gouty kidney*. This disease comes on slowly, may be the result of acute B. D., but is more frequently the result of *gout* or some allied affection. Here iron tonics will be of great benefit. A common result of B. D. is the retention of *Urea* (q. v.) in

the blood, producing convulsions and death. (See *URÆMIA*.) Both forms of B. D. are very serious affections, and the advice of a physician should be had at once.

Brighton (formerly *Brightelmstone*, and originally *Brihtelmeston*), a fashionable watering-place on the coast of Sussex, 50 miles S. of London by rail, lies on a slope, and is sheltered by the cliffs of the S. Downs. It is handsomely built, extending along the shore upwards of 3 miles, and has a beautiful beach, and many popular attractions. The chief of these is the aquarium (opened in 1872), which stands below the cliff of the Marine Parade, and has a length of 715 feet and a breadth of 100. It has three corridors and over fifty tanks, ranging from 11 to 100 feet in length, and there is also a magnificent conservatory, fitted up as a lounge. B. has two piers, a wooden one raised on piles (1865-66), and a chain-pier (1134 feet long and 13 wide), which, together with the 'parades,' afford ample scope for promenading. The principal building is the Pavilion or Marine Palace, a partly graceful, partly grotesque pile of domes, minarets, and pinnacles. It was originally built for George IV. (1784), but was bought for £53,000 by the corporation (1849), who have opened it and its beautiful pleasure-grounds to the public as places of recreation. B. has also the N. Steyne Enclosures, the Lovel, and the Queen's Parks. There is, however, a scarcity of trees everywhere, owing to the adverse sea-breezes. The town has no important trade, but derives its revenues from the ceaseless influx of holiday visitors. There are numerous splendid hotels, boarding-houses, and schools. B. sends two members to Parliament. Pop. (1877) 100,638.

Brignoles, an old town of France, department of Var, on the Calami, 23 miles W.S.W. of Draguignan. It has an antique palace of the Counts of Provence, an old house of the Templars, and a beautiful building bearing date of the 12th c. There are manufactures of silks, broadcloth, brandy, soap, leather, &c., and trade in wines, prunes, and other fruits. Pop. (1872) 4626.

Brihuega, an old and once walled town of New Castile, Spain, on the Tajüña, 20 miles E.N.E. of Guadalajara. It has manufactures of linen, woollens, glass, leather, &c. Pop. 4500. Here, in 1710, the English general Stanhope was compelled to surrender to the Duc de Vendôme.

Bril, Mattheus and Paul, two Flemish painters. Mattheus, born at Antwerp in 1550, removed to Rome and laboured in the galleries of the Vatican, where he painted several frescoes. He died in 1584. Paul B., his younger brother, but the greater artist, was born at Antwerp in 1556. He was a follower of Titian and Annibal Carracci. His works, conspicuous for their fine sky-lights and for their air of rest and solemnity, are to be met with in the Louvre, at Dresden, Florence, Düsseldorf, &c.; but his masterpieces are at Rome. His 'Martyrdom of St Clement,' a fresco 68 feet long, is in the Pope's gallery, Rome. He also painted landscapes of exquisite delicacy and finish on copper. B. died at Rome in 1626.

Brill (*Rhombus vulgaris*), a species of *Pleuronectidae*, or 'flat-fishes,' belonging to the turbot genus (*Rhombus*), in which the eyes are on the left side of the head, teeth existing in the jaws and throat, and the dorsal fin commencing in front of the eyes. These fishes, it is to be noted, are only *flat* in the sense that the sides of the body are more compressed than in other fishes, and both eyes, by the twisting of the bones of the head in early life, come to be placed on one side of the head. The B. averages about six or eight pounds in weight. It is not so broad as the turbot, and is coloured sandy or reddish brown on the upper side, spotted with white. The B. forms a characteristic British food-fish.

Brilliant, the name given to a diamond when cut in a particular form which displays its lustre to the best advantage. See DIAMOND.

Brimstone (formerly *brinstone*, from Old Eng. *byrnan*, to burn), the commercial name for sulphur in sticks or rolls.

Brindisi (anc. *Brundisium*), a rapidly-increasing seaport in the province of Lecce, S. Italy, on the coast of the Adriatic, 70 miles S.E. of Bari by railway. It lies between two headlands at the mouths of the Patricio and Masina, is surrounded by walls and bastions, and protected by the island-fort St Andrea. B. is the seat of a bishop, and has a splendid harbour and roadstead.

The harbour consists of an E. and W. inner dock, nearly surrounding B., and a strait passage or canal connecting these with the outer docks. These docks have been deepened, walled, and defended by the Government since 1866, and are now in an excellent state. In 1870, B. was made a port of embarkation in the English overland route, and in 1874 the chief Mediterranean coaling station of the Oriental and Peninsular Company. In 1874 there entered the port 940 vessels of altogether 310,186 tons, and cleared 939 of 380,069 tons; while the imports amounted to £363,000, exports to £172,400. The articles of import are chiefly Japanese silkworms' eggs, wheat, flour, coal, raw silk, and cattle; exports, dried fruit, manufactured silk, and coral, olive oil, wine, and jewellery. A marsh near B. (*Fiume Piccolo*), the cause of much malaria, was being drained and filled up in 1875. Pop. (1870) 9105. B. was in very early times a chief town of the Sallentines; and the Romans, having taken it in 267 B.C., made it a colony in 244, when it rose rapidly into wealth and importance, from the fertility of the territory and the excellence of its port both for commercial and naval purposes. It was called in the native dialect of the Messapians *Brention* or *Brentesio*, i.e., 'stag's head,' on account of the configuration of its harbour. The chief Roman naval station in the Adriatic, such was its importance, that Hannibal attempted unsuccessfully to seize it. The Roman generals embarked and disembarked here the troops that were to cross the Adriatic, as it was the most convenient point of communication between Rome and the eastern provinces. Pacuvius the tragic poet was born at B. about 220 B.C., and here Virgil died 19 B.C. The fall of the Latin Empire reduced the importance of the town. When the Normans wrested it from the Greek Empire, in the 11th c., it became the great port of embarkation for the Crusades. The haven was afterwards greatly destroyed by Duke Anton of Tarentum, and later by the Venetians. See Cora, *Da B. à Suez* (Casale, 1869); and Andree, *B. in seiner Bedeutung für die Ueberlandroute* (Stuttg. 1870).

Brindley, James, a great mechanic and engineer, born at Wormhill, in Derbyshire, in 1716. When forty years old his attention was turned to inland navigation in connection with the Duke of Bridgewater's canal between Worsley and Manchester, and the remainder of his life was devoted to this subject, the difficulties of which he grappled with and overcame as no one had done before him. B. died at Turnhurst, Staffordshire, 30th September 1772.

Brine is the name given to a strong solution of common salt in water.

Brine Shrimp (*Artemia salina*), a curious genus of Crustacea, belonging to the section *Branchiopoda* (q. v.), and to the order *Phyllopoda*. It derives its name from the fact that it inhabits the brine-pans of saltworks, and also occurs in natural salt lakes, as in the Great Salt Lake of Utah. In the Lymington salt-pans of England, these forms inhabit a briny solution of a strength sufficient to pickle beef. The feet are numerous, and bear the branchiæ or gills, and during their development shrimps then undergo a definite *metamorphosis*, and multiply with great fecundity.

Brinvilliers, Marie Marguerite, Marquise de, notorious for her gallantries and crimes, was the daughter of Dreux d'Aubray, Municipal Lieutenant of Paris, and was married in 1651 to the Marquis de B., who introduced her to a handsome officer, named St Croix, for whom she conceived an uncontrollable passion. To separate the lovers, her father imprisoned St Croix in the Bastille, where he learned from an Italian named Exili the art of mixing poison. On his liberation he taught his mistress the fatal secret. She practised first on her father, who died in eight months; she then turned her art against her two brothers, and next against her husband the marquis. But he was saved by antidotes given him by St Croix, who, though he had no scruple in wasting in extravagance her paternal inheritance

Brine Shrimp.

with his mistress, is understood to have been unwilling to become her husband. St Croix became the victim of his own criminality, having died suddenly in 1672, from accidentally breathing the effluvia of a poison he was preparing. He left papers which pointed to the guilt of the marchioness, but she escaped to England, and afterwards resided for some time in a convent at Liège. Here she was captured and conveyed to Paris. Her sentence, that she should be beheaded and her body burnt, was carried into effect July 16, 1676. The poison used by B. is thought to have been common arsenic. See the *Histoire du Procès de la Marquise de B.* (Par. 1676).

Brioude (the ancient *Brivas*), a town in the department of Haute-Loire, France, situated near the Allier, 29 miles N.W. of Le Puy. The principal building is the Byzantine church of St Julien, originally built in the time of Constantine, and rebuilt in the 11th and 12th centuries. This structure is richly ornamented with the most delicate sculpture. B. has also beautiful fountains of the 13th c. There is a small lace industry, and a trade in wine and maize. Pop. (1872) 4484. B. was the birth-place of Lafayette.

Brisbane.—1. A county in the S.E. part of Queensland.—2. A river in Queensland, which, after a course first S. and then E. of 170 miles, flows into Moreton Bay (q. v.), in 27° 40' S. lat., 153° 43' E. long.—3. An episcopal city, the capital of Queensland, situated on both banks of number 2, about 25 miles from its mouth, in 27° 28' S. lat., 153° 6' E. long. It was founded as a penal settlement in 1825, but was not open to free settlers till 1842. It is pleasantly situated, the river being a quarter of a mile broad, and the scenery picturesque. B. is well laid out; among the principal buildings are the Houses of Legislature, which cost £100,000; the vice-regal lodge, post-office, and custom-house. The Victoria Bridge over the B. (1874) is 1013 feet long. None of the churches deserve notice. B. possesses some excellent charitable and educational institutions, and supports four newspapers, two of which are published daily. It is lighted with gas and well supplied with water. Vessels drawing more than 16 feet cannot come up to B., on account of the bar at the mouth of the river. Pop. (1871) 19,413. All the foregoing are named after the subject of the succeeding article.

Brisbane, General Sir Thomas Makdougall, G.C.B., was born at Brisbane House, Largs, 23d July 1773, entered the army in 1789, and served under the Duke of York in Holland, and under Sir Ralph Abercromby in the W. Indies. In 1812 he joined Wellington at Coimbra, and distinguished himself at Vittoria and Nives, his conduct in this last action procuring for him the thanks of Parliament. On the abdication of Napoleon, B. was sent to N. America in command of a brigade, but was recalled after the escape from Elba, though not in time for Waterloo. In 1816 he was elected a corresponding member of the Institute of France; in 1821, on the recommendation of the Duke of Wellington, he was appointed Governor of New South Wales, where he remained four years. His administration was marked by many wise reforms. At an observatory which he erected 14 miles from Sydney he catalogued 7385 stars previously little known, and for this he received the gold medal of the Royal Astronomical Society. On his return from Australia he erected an observatory at Makerstoun, adding a magnetic observatory in 1841. On the death of Sir Walter Scott in 1833, B. was elected President of the Royal Society of Edinburgh. He died 27th January 1860. (*Transactions of the Royal Society of Edinburgh*, vol. xxii. pp. 589-605.)

Brissot de Warville, Jean Pierre, one of the best of the French Revolutionists, was born at Chartres, 14th January 1754. Although educated for the bar he devoted himself to authorship, for which his passion for literary studies, particularly history, politics, and political economy, peculiarly qualified him. His *Bibliothèque des Lois Criminelles* gained him great reputation as a jurist, and his abilities were recognised by Voltaire and D'Alembert. His enthusiasm for freedom brought him under the suspicion of the French court, and he had to take refuge for a time, first in England and then in N. America. The outbreak of the Revolution, however, brought him back to Paris. He became the representative of Paris in the Constituent Assembly, and his patriotism and ability soon made him the real chief of the party

known as the Girondins. B., however, made a political mistake when he attempted to stem the tide of revolution and save the life of the King. Such was the agitation, credulity, and terror of the public mind, that to be moderate in those frenzied days was to court destruction. He and his party fell before the fiercer faction of the Mountain, and B. was guillotined October 30, 1793. B.'s treatises were published along with his *Mémoires* (1829-32) on political and social questions, but they are long forgotten.

Bristles are modifications of hairs found in various mammals. B. differ from hairs chiefly in the denser and firmer nature of their epidermis or horny outer cells. They are obtained chiefly from the backs of wild and domesticated swine, and are largely imported into Britain from Germany, Poland, Denmark, and Russia, for the purposes of the brushmaker. Russia is the great exporting country, the Ukraine B. being accounted of finest quality. The 'lily'-coloured B., used for making shaving and other soft brushes, are the most valued; other colours being black, grey, and yellow. In 1864 Britain imported from Russia 1,958,112 lbs., valued at £252,923; from Hamburg 207,274 lbs., worth £26,772; from France, Prussia, and other parts of Europe, 184,749 lbs., valued at £24,336. In 1867 the total import amounted to 2,378,526 lbs.

Bristol, a cathedral city, the third seaport of England, and the western commercial centre, forms a county in itself, and is situated between the counties of Gloucester and Somerset, 120 miles W. of London by railway. It lies partly in the sheltered valleys and plains of the Avon and the Frome, partly on rising ground and steep slopes, and gains from the irregularities of its position a singularly picturesque appearance. The site rises and falls on every side, and there is a difference of 300 feet between the highest and lowest levels. West from Bristol, and overlooking both the city and the Avon, lies the picturesque suburb of Clifton (q. v.). There is here a magnificent suspension-bridge over the Avon, 702 feet long, and 245 feet above the river at high tide. Some half-a-million sterling has been expended on recent city improvements in the older part of B., but a good deal still remains to be done in this way. B. has been called 'the city of churches,' and among its principal public buildings are the cathedral, which has recently received the addition of a beautiful nave, costing £40,000; Redcliffe Church, 'the finest parish church in England,' with its newly-completed spire and its muniment-room, in which Chatterton professed to have found the pseudo poems of Rowley; and the Temple Church, the peculiarity of which is its leaning tower. There are also some 150 other churches. Of other fine buildings may be mentioned Clifton College, erected in 1867, the B. General Hospital, Colston Hall, the West of England Bank, the Guildhall, a handsome theatre (1867), and the new Central Railway Terminus. The new 'University College, Bristol,' in 1878 had 418 students. The harbour has been greatly improved, and there are now (1879) a mile and a half of quays. In February 1877 the new Avonmouth Dock, of 16 acres, and costing £600,000, was opened. B. has manufactures of cotton and linen goods, chemicals, leather, floorcloth, and earthenware. There is also much sugar-refining, and an important shipbuilding industry. But it is as the seat of an old and extensive foreign commerce that B. has risen to importance. It long monopolised the W. Indian trade, in which one of the chief commodities was the African slave, and now possesses a rich share of British commerce. In 1873 there entered the port 1145 vessels in the foreign and colonial trade (408,999 tons), and 8208 coasting vessels (187,773 tons); cleared, 469 vessels in the foreign and colonial trade (650,072 tons), and 8391 coasting vessels (855,266 tons). Pop., as established by Registrar-General (1875) 196,186; (June 1877), 199,539. B. returns two members to Parliament. It is first mentioned in early records by the old British name of *Caer-ader*, and after being a Roman station, was re-occupied by the Britons, who were expelled in 584 by the English, by whom it was called *Bricgstow* ('the place of the bridge'), hence its present name. In these early times, even, it acquired a reputation for trade, especially in British slaves. In 1372 Edward III. made it an independent city and county, and it was constituted a bishop's see by Henry VIII. The *Bridge Riots* took place in 1793, but were far eclipsed by the famous *Reform Bill Riots* of 1831, in which some 500 persons were killed, and 100 houses burned, including the mansion-house, the prisons, and the bishop's palace. B. is the birthplace of Cabot the navigator, 500

Chatterton and Southey the poets, Bowdich the African traveller, and many other men of eminence. See *B. and its Environs*, by the Local Executive Committee of the British Association (Brist. 1875).

Bristol Bay, an inlet of the Pacific Ocean, on the N. side of the peninsula of Alaska, U.S. It receives a river of considerable size, on which there is situated a fort or station.

Bristol-Board is a kind of card-board used in sketching, and formed by pasting together two or more thicknesses of white paper.

Bristol Channel, the largest inlet in Britain, forming an expansion of the estuary of the Severn, and separating S. Wales from the N. coast of Somerset and Devon. It is about 80 miles long, extends from 5 to 48 broad, and receives a drainage area of 11,000 square miles. Numerous rivers enter it, the chief of which are the Severn, Avon, Axe, Parrot, Taw, Torridge, Towy, Taff, Usk, and Wye. The tide, which rises 35 feet at Bristol, 40 at King's Road, and occasionally 70 at Chepstow, flows so rapidly as to produce in the mouths of the rivers, and in the estuary of the Severn, the phenomenon of the *bore*, in which the water advances in a single wave some 8 feet in height.

Britain. See GREAT BRITAIN.

Britannia was the ancient name of S. Britain and Caledonia. Its derivation has been keenly disputed, and is still doubtful. The Celtic *brith* or *brit*, 'painted,' is extremely improbable. A Briton who painted his body would not call attention to the circumstance by a name. A foreigner might have done so, but he would hardly have used a Welsh word for the purpose. Isaac Taylor's supposition that the word is mainly Iberic or Basque, and merely signifies a country or district, does not seem a happy conjecture. Caesar invaded Britain in 55 and in 54 B.C. Plautius, Ostorius, and Vespasian under Claudius, and Suetonius under Nero, by their victories, especially those over Caractacus and Boadicea, subdued the southern and awed the northern Britons. In 61 A.D., Agricola, under Vespasian and Domitian, successfully led his legions into the N., secured his conquests by chains of forts between the Tyne and Solway, and between the Forth and the Clyde; penetrated beyond the Forth, sailed round the island, and closed his seventh campaign, A.D. 84, by the defeat of Galgacus at Mons Grampius. In 119 A.D., Hadrian drew the frontier of his dominions from the Tyne to the Solway, by strengthening the works of Agricola on that line; but in A.D. 139, Lollius Urbicus once more attempted to maintain the advanced frontier of the Forth and Clyde by strengthening the defences of Agricola. In 208 A.D., however, Severus retired on the old line of Hadrian, and threw up beside it a second earthen rampart. Thereafter, till their final withdrawal from B. in 410 A.D., the Romans ruled the southern portion of the island alone, and even there they suffered much from the unceasing inroads and cruel depredations of the Scots and Picts, and of the Saxons. At the beginning of the 5th c., B. was divided into five provinces, Maxima Caesariensis, Flavia Caesariensis, B. Prima, B. Secunda, and Valentia. These were governed by consulars and presidents, subject to the Vicarius, at Eboracum (York), the seat of the Roman government. At that time also there were ninety-two considerable towns, protected by the Romans, and of these thirty-three were cities; and the British Church might reckon thirty or forty bishops. The antiquities of B. are partly British and partly Roman. The former consist of barrows, earth-mounds, monoliths, cromlechs, and cairns; the latter, of pavements, altars; metal implements and ornaments, pottery, encampments, walls, roads, coins, and inscriptions.

Britannia Metal, a compound metal of a white, silvery aspect, of considerable malleability, extensively used for the cheaper class of tea-pots, spoons, hot-water jugs, &c. It is composed of equal parts of brass, tin, antimony, and bismuth. See **FEWTER** and **QUEEN'S METAL**.

Britannia Tubular Bridge, a bridge carrying the Chester and Holyhead Railway over the Menai Straits. It was designed by Mr Robert Stevenson, commenced in 1846, and completed in 1850. The difficulties in its construction were numerous, among which the principal were that the nature of the site rendered it necessary that the two principal spans should

each have a clear width of 460 feet, and that the parliamentary committee insisted that the under side of the roadway should nowhere be less than 103 feet above high-water mark. The latter condition rendered it impossible to use an arch, and it did not seem practicable to stiffen a suspension bridge sufficiently to render it safe for railway traffic. The girder bridges, now universally used, were unknown, and the theory of beams imperfectly understood. Under all these difficulties and disadvantages, Mr Stevenson conceived the idea of making the bridge of huge hollow beams, through the centre of which trains should run, and proved its practicability by an elaborate series of experiments on the strength of tubular beams, in which Sir William (then Mr) Fairbairn, Mr Eaton Hodgkinson, and Mr Edwin Clark took part. The tubes of which the bridge consist are made of wrought-iron plates riveted together (a method of construction then almost as novel as the design of the bridge), the top and bottom of the tubes being cellular. The four tubes composing the two centre spans each weigh about 1800 tons; they were constructed on shore, floated on pontoons to the piers, and then raised by hydraulic presses into their places at the rate of about 6 feet per day—the speed being limited by the rate at which brickwork could be built up underneath the tubes as they were lifted. The total cost of the bridge was over £60,000, and it was completed in less than five years.

Britannicæ Insulæ was the name given by writers earlier than Cæsar to the two large islands, Albion and Ierne, and the numerous smaller ones around them. Albion was England and Scotland; Ierne, Ireland. Cæsar first calls Albion Britannia, as opposed to Ierne. Ptolemy calls Ierne Little Britain; and Albion, Great Britain. Hence the legend on our coins, Britt., or Britanniar. Reg.

British Army. The basis of the modern B. A. is the Bill of Rights, which became law in 1690, as the legalised form of that Declaration of Rights (q. v.) which the Prince and Princess of Orange accepted along with the British crown. It enacts that the raising and keeping up of a standing army in time of peace, without consent of Parliament, is contrary to law. From the time of the passing of that Act to the present, the number of troops required for the security of the kingdom, and its possessions and dependencies, as well as details of the cost of different branches of the service, has been sanctioned annually by a vote of the House of Commons. The Government of the day, from a political view of the state of affairs at home and abroad, fixes, at a meeting of the Cabinet, held shortly before the beginning of a parliamentary session, the amount of military service required for the coming year. The Secretary of State for War then frames his Army Estimates (q. v.), and these are discussed and finally settled for the year early in the session by the House of Commons. The Mutiny Act (q. v.), first passed in 1689, and which has to be annually renewed, supplies Parliament with another important means of controlling the B. A. Soldiers, in time of war or rebellion, being subject only to martial law, are obnoxious to that law for mutiny, desertion, or any other military offence, and may be punished by it accordingly. But when the army began to be maintained in time of peace, questions of discipline arose, and it was decided in the courts of law that, in the absence of any statute specially applicable to their circumstances, a soldier was amenable only to the common law of the country: if he deserted, he could be punished for breach of contract; if he struck his officer, he was liable merely to an indictment for assault. The authority of Parliament became, therefore, necessary for the maintenance of military discipline, and the Mutiny Act invests the crown with extensive powers to make regulations for the good government of the army, and to frame the articles of war which constitute the military code of laws. As to the supply of men to fill its ranks, the B. A. differs from that of nearly every other military power in Europe. Service in it is voluntary. Subjects of the crown, of their own choice, enlist in it for a specified number of years—twenty-one years' service securing a pension. The only service which is forced by ballot is in the Militia (q. v.). The following order of precedence, contained in the Army Regulations published in 1873, presents also the principal component elements of the B. A. The order of precedence of the several regiments and corps in Her Majesty's service is: the regiments of life-guards and the royal regiment of horse-guards; the royal horse-artillery; the cavalry of the line; the royal artillery; the royal engineers; the foot-guards; the infantry

of the line; the departmental corps. The royal marines, when acting with the troops of the line, take rank next to the 49th regiment. The rifle brigade ranks next to the 93d regiment. The militia regiments have precedence after those of the line, according to their respective numbers, as fixed by lot. There are, in addition to these, other component elements which do not remove the men, making them up from their rank as civilians. Besides the militia, there are the yeomanry cavalry, the volunteer artillery and rifles, the enrolled pensioners, and the dockyard battalions. The corps raised in and belonging to the principal colonies, and the troops maintained out of the revenues of India, also belong to the army of the British Empire, if not to the B. A. Under various laws of army reorganisation, which were completed in 1873, Great Britain and Ireland are partitioned into ten military districts, or general officers' commands, which are further subdivided into sub-districts, the division varying with the arms of the service. There are sixty-six sub- or brigade-districts for the infantry, commanded by line colonels; for the artillery there are twelve sub-districts, commanded by artillery colonels; and there are two districts for the cavalry, commanded by cavalry colonels. The brigade of an infantry sub-district consists, as a rule, of two line battalions—one generally abroad and the other at home—two militia battalions, the brigade depot, rifle volunteer corps, and infantry of the army reserves. An artillery sub-district contains, in addition to the royal artillery, the militia artillery, the artillery of the volunteers, and that of the army reserve. The cavalry colonel commands the cavalry regiments within his district, and also the yeomanry, volunteers, and reserve cavalry. (See DISTRICT, MILITARY.) The number of regiments in the B. A. has varied very little since 1820. There are at present (1875) 31 regiments of cavalry, 2 of artillery and engineers, and 113 of infantry—146 regiments in all. The number of men in the army is enlarged or lessened, not by embodying new regiments or disbanding any of those which exist, but by varying the number of battalions in a regiment, of companies in a battalion, or of men in a company. The effective numbers of the B. A. in 1874 were: officers, 9780; soldiers, 215,055; total, 224,835. There were 26,453 horses for men in the cavalry, and 4177 officers' horses: total, 30,630. The reserve forces—including the yeomanry cavalry, the militia, and the volunteers—counted 302,868 officers and men, with 19,420 horses. The total number of the regular army and the reserves in that year, then, was 527,702 men, and 50,050 horses. Arrangements were completed in 1875 for a complete mobilisation of the B. A. (See MOBILISATION.) The total cost of the B. A. for the year ending March 31, 1874, was £13,231,400. The establishments for educational purposes in the same year were reckoned in the army estimates to cost £133,930. These comprise the council of military education, the academy at Woolwich, the college at Sandhurst, the asylum and normal school at Chelsea, the military school at Dublin, the department for instruction of military officers, the military medical school, and a varying number of garrison schools and libraries.

British Association for the Advancement of Science is an association of scientists eminent in their several departments, and was primarily formed with the intention of giving an impetus to scientific inquiry and discovery, of publishing over the whole country the latest results of such research, and of exciting in the mind of the British public a desire for more thorough acquaintance with scientific facts and theories. The B. A. was established by Sir David Brewster, Sir R. J. Murchison, and others; but its conception and foundation must in great measure be ascribed to Brewster, through whose exertions the first meeting was held at York on September 27, 1831. At this meeting the society was divided into several sections, laws and bylaws passed affecting its constitution, its next place of meeting determined, and subjects proposed on which reports were then to be read. The president delivers an inaugural address, which is usually an enumeration and criticism of the latest and most striking discoveries. The place of meeting for 1876 is Glasgow (for 1877, Plymouth), and the president-elect is Sir Robert Christison. The B. A. embraces at present seven sections, thus named—Section A, Mathematics and Physical Science; B, Chemistry; C, Geology; D, Zoology and Botany, including Physiology; E, Geography and Ethnology; F, Economic Science and Statistics; G, Mechanical Science and Engineering. The *Proceedings* (1831-75) form a valuable scientific library.

British Gum, or Dextrine, is obtained either by heating starch by itself to a temperature of 150° , or by maintaining a mixture of 1 part of starch, 3 of water and $\frac{1}{2}$ of oil of vitriol for some time at a temperature of 90° C. Dextrine is a solid amorphous substance, soluble in water in all proportions. Its solution in water is mucilaginous, and is much used as a substitute for gum arabic, especially by the calico-printer, as a vehicle for colours. Its chemical composition is identical with that of starch, both having the formula $C_6H_{10}O_5$; it differs from starch in colouring dilute solutions of iodine red, whereas starch colours them blue. Diastase (q. v.), or dilute sulphuric acid, causes it to take up water to form *glucose*, or grape-sugar.

Dextrine. Water. Glucose.

British Museum, a national collection of the greatest value, situated in London. It dates its origin from a bequest by Sir Hans Sloane in 1753. Sir Hans directed that his library, consisting of 50,000 volumes, and his valuable collection of antiquities and works of art, should be handed over to the Government on condition of £20,000 being paid to his family. By means of a lottery the sum of £94,194 was raised, and the required £20,000 was thereupon paid for the Sloane collection. This, with the Hamilton collection of Roman antiquities, and the Cottonian and Harleian collections of MSS., was placed in Montague House, the Duke of Montague's town residence, which was bought for the purpose. Thenceforth the new institution bore the name of 'The B. M.' It was opened to the public for the first time on 15th January 1759. Large and valuable additions being rapidly made to the contents of the museum, the accommodation afforded by Montague House soon became quite insufficient. At length, on the library formed by George III. being presented to the nation by George IV. in 1823, it was resolved to erect a new building. The plans were prepared by Sir R. Smirke, and the eastern side of the present edifice was completed in 1828. By 1845 Montague House had disappeared, and the new building been erected in its stead. Further additions have been made to the building at various times, the most important being the new reading-room and adjoining libraries. The reading-room was erected in the three years 1855-57, at a cost of about £150,000. Iron has been principally employed in its construction, the main ribs resting upon brick arches. The dome is 106 feet in height, and 140 feet in diameter. The quantity of glass used is about 60,000 square feet. Great pains have been taken to ensure proper ventilation. The building comprising the reading-room and library, is situated in the inner quadrangle, and in order to lessen the danger from fire, the building is separated from the rest of the museum by a clear space of 28 feet. This inner building occupies an area of 48,000 square feet. The exterior edifice belongs to the Ionic style of architecture. It is in the form of a square, the southern face, towards Great Russell Street, being the principal one. It consists of a columnar façade 370 feet long, with a grand entrance portico at the centre. Including the houses of the chief officers, situated one at each end of the front of the building, the entire face of the museum is 570 feet in length.

The museum is under the management of forty-eight trustees, the chief of whom are the Archbishop of Canterbury, the Lord Chancellor, and the Speaker of the House of Commons. During 1875 the staff of the museum consisted of 23 principal officers, 87 assistants, 145 attendants and servants, and 67 artisans, &c.—in all, 322 persons. The total sum voted for the maintenance of the establishment and all other expenses during the financial year 1875-76 was £107,451. The museum is open free to the public every Monday, Wednesday, and Friday, as well as every Saturday during the summer months. During 1874 the museum was visited by 601,843 persons, including those by whom the reading-room was used.

The contents of the B. M. were originally divided into three departments—viz., Printed Books, MSS., and Natural History. At the present time there are, in addition to these, eight other departments—viz., Oriental Antiquities, British and Mediæval Antiquities and Ethnography, Greek and Roman Antiquities, Coins and Medals, Botany, Prints and Drawings, Palæontology and Mineralogy. Each of these departments is under the immediate charge of an 'under-librarian,' the head officer of the entire establishment being styled the 'principal librarian.' A

brief notice of the contents of the several departments is subjoined:—

1. **Printed Books.**—These form the largest department in the museum. The Sloane collection, and a much smaller one bequeathed to the nation in 1738 by Major Edwards, formed the nucleus. In 1757 George II. gave to the museum the library collected by the Kings of England from Henry VII. downwards, the gift including the libraries of Cranmer and Casaubon. With the gift of the royal library, the same sovereign conveyed to the museum the right to a copy of every publication entered at Stationers' Hall. A number of private donors, chief among whom were Dr Bentley and Sir Joseph Banks, swelled the contents of the library. In 1823 came the gift of George IV. already mentioned. Its value was nearly £200,000, and by the terms of the gift it is kept separate from the other books, being known as the King's Library. In 1846 the Right Hon. Thomas Grenville bequeathed to the museum his own library, containing more than 20,000 volumes. At the present time (1875) the entire library of the B. M. consists of about 800,000 volumes, besides a much larger number of parts of volumes. During 1874 there were added to it 37,000 volumes, of which 28,000 were purchased. These figures include music and newspapers. More than 40,000 parts of volumes were also added during the same period. The average daily number of readers in the reading-room in 1874 was 358. More than 29,000 volumes from the general library were consulted, besides 825,000 taken by students from the shelves of the reference library. Permission to use the reading-room is now easily obtained, but originally the *entrée* was confined to a privileged few. In July 1759 the reading-room was attended by only five readers. Accommodation is now provided for 300 readers, each of whom is allotted a space four feet three inches long. The B. M. library contains upwards of twenty-five miles of shelves, on which are to be found the rarest and most precious books, among them being copies of the first edition of almost every famous English work extant. Of some books there are copies of many editions—e.g., of the *Pilgrim's Progress*, seventy-five in English, and twenty-nine in other languages; of the *Paradise Lost*, seventy-two in English, and fifty-two in other languages; and of *Robinson Crusoe*, one hundred, of which seventy-four are in English. The catalogues form quite a library in themselves, as may be conceived from the fact that the heading 'William Shakespeare' alone fills two folio volumes.

2. **Manuscripts.**—These are principally bound in volumes, and comprise many priceless treasures. The collection has been added to at different times by various donors. Among its contents may be enumerated the original *Magna Charta*, a mortgage-deed signed by Shakespeare, Milton's contract for the disposal of the *Paradise Lost*, and the original MSS. of many famous English works; many precious documents of much greater antiquity, such as the *Codex Alexandrinus* (a transcript of the Bible in uncial Greek, dating from the 5th c.), and the earliest copies of the *Iliad* and *Odyssey*; likewise autographs of celebrities of many ages and nations.

3. **Oriental Antiquities.**—In this department are included Egyptian and Assyrian antiquities. The former comprise sculptures of all kinds and sizes inscribed with Hieroglyphics (q. v.), idols, articles of dress and furniture, mummies, &c. One of the most interesting and valuable of the objects exhibited is the celebrated Rosetta Stone (q. v.). The Assyrian antiquities include the sculptures brought from Nimrud, Khorsabad, and Kouyunjik by Layard and others, many of them being covered with pictorial representations of historical events, and inscribed with cuneiform characters. In 1873-74 valuable additions were made to this collection in the shape of a large number of burnt clay tablets, excavated at Kouyunjik by Mr George Smith. These tablets have been in part deciphered by Mr Smith, who has found them to contain Chaldean legends of the creation, fall, deluge, building of the Tower of Babel, &c. The tablets were presented to the museum by the proprietors of the *Daily Telegraph*, at whose expense Mr Smith's labours in Assyria were conducted.

4. **British and Mediæval Antiquities and Ethnography.**—In this department are to be found antiquities anterior to the Roman occupation of Britain, antiquities of the Roman period, Anglo-Saxon antiquities, and sculptures, carvings, metal-work, enamels, glass, pottery, &c., of different European nations down to the 17th c. There is also a small collection of antiquities found in the catacombs of Rome, and relating to the early Christians.

The ethnographical collection includes both the antiquities and the objects in modern use belonging to all nations not of European race.

5. *Greek and Roman Antiquities*.—The most famous of the Grecian antiquities contained in this collection are—the Lycian Gallery, consisting of a number of bas-reliefs, friezes, &c., brought from the ancient cities of Lycia in Asia Minor in 1842–46 by a British Government expedition under the direction of Sir C. Fellows; the Elgin Marbles (q. v.), collected by the seventh Earl of Elgin in 1801–3, and purchased from him in 1816 by the nation for £35,000; and the Hellenic marbles, obtained in various parts of Greece (exclusive of Attica) and its colonies. The most valuable of the last is a collection known as the Phigalian Marbles, discovered in 1812 amongst the ruins of the temple of Apollo Epicurius, near the ancient city of Phigalia, in Arcadia. In 1874 there were added a number of valuable inscriptions excavated by Mr Wood on the site of the Temple of Diana at Ephesus. Of the Roman collection, one of the leading features is the gallery containing the Townley Marbles, purchased for £20,000 in 1805, after the death of Mr Charles Townley, by whom they were collected. They consist of a number of statues and busts. The other Roman antiquities consist principally of vases, called Etruscan, bronze ornaments and weapons, lamps, urns, &c., as well as architectural fragments.

6. *Coins and Medals*.—In this department is arranged an immense number of coins, &c., of every age, the Roman and Anglo-Saxon collections being the most noteworthy. The arrangement of the department is most excellent.

7. *Botany*.—To the bequest of Sir H. Sloane, consisting of about 8000 species, many valuable additions were made in succeeding years, both by bequest and by purchase. Chief among the bequests was that of the splendid herbarium of Sir Joseph Banks in 1820; and among the purchases may be mentioned that of Professor Nuttall's collection in 1860. There is also on view a large collection of woods and other vegetable structures not suited to a herbarium.

8. *Prints and Drawings*.—Up to 1840 the collections of this department consisted entirely of bequests, but since that date extensive purchases have been made, and there are now to be seen here drawings and engravings illustrative of all the schools of European art.

9. *Paleontology*.—This department contains a valuable and interesting collection of fossil animals and plants, obtained in all parts of the globe.

10. *Mineralogy*.—The collections of this department occupy four rooms, and among their most interesting features may be mentioned the meteorites, including one weighing 3½ tons, found at Cranbourne, Australia.

11. *Natural History*.—This department received by gift, made during 1874, Mrs J. E. Craig's collection of shells, comprising 12,000 specimens, representing 4000 species. In the same year there was purchased for its use Mr Edward Saunders's collection of beetles, numbering 7267 specimens. The zoological collections at present occupy three galleries, but as this space is quite inadequate to their requirements, a new building, intended specially for their accommodation, is in course of erection adjoining the South Kensington Museum. The total cost of this new building will be £395,000, and it will probably be completed in 1877. See Edwards' *Lives of the Founders of the B. M.* (2 vols. Lond. 1870), and Nichols' *Handy-book of the B. M. for Everyday Readers* (2d ed. Lond. 1870).

British Navy, the materiel and personnel of the war-fleet of Great Britain. A naval force in time of peace was first maintained in this country by King Henry VII., who built the *Great Harry*, a three-masted ship, carrying 80 guns, the first line-of-battle ship of the B. N. Henry VIII. matured very considerably his father's plans for the establishment of a permanent fleet of ships of war. Among others, he caused to be built the *Regent*, the *Marie Rose*, and the celebrated *Henri Grâce de Dieu*, 72 guns, 700 men, and 1000 tons burden. At the end of his reign, in 1547, there was a navy comprising 71 vessels of all sorts, and measuring 11,268 tons. The naval force of England was considerably diminished during the reign of Edward VI. and Mary; but the exigencies of the long reign of Elizabeth caused it to revive greatly; and at her death, in 1603, the fleet counted 42 ships, measuring 17,055 tons, and 8346 seamen. Phineas Pett,

the ablest naval architect England had produced, lived during the reign of James I., and the art of shipbuilding was indebted to him for many improvements. At the death of James, in 1625, the B. N. consisted of 33 ships, their tonnage measuring 19,400. Charles I. divided the navy into rates and classes. At the beginning of his reign he caused several new ships to be built,—among others, the *Sovereign of the Seas*, 100 guns, 1637 tons, the largest ship that had ever been built in England. But it was under Cromwell that the ratings were clearly defined, and that regular system was established which remains in force to the present time. At the Protector's death, in 1658, the ships in the navy numbered 157; their tonnage, 21,910; and they carried 50,000 men. A new era in the B. N. began at the Restoration of Charles II., in 1660. Under the energetic administration of the Lord High Admiral, the Duke of York, the royal fleet became a fine armament. Notwithstanding the decay into which it had been allowed to fall during a portion of his reign, at the death of Charles, in 1686, the navy amounted to 179 ships, of 103,558 tons. During this reign great advance was made in mechanical science, and it was at once applied to naval architecture. When the Duke of York mounted the throne, as James II., he continued to evince a warm interest in the B. N. At his abdication, in 1688, it was a force of 173 vessels, of 101,892 tons, 6930 guns, and 42,003 men. Under William and Mary, 99 new ships were added to the fleet; and it was the celebrated engagement off Cape la Hogue, in 1692, which gave the B. N. its ascendancy over that of France. At her accession, Queen Anne came into possession of a navy consisting of 272 vessels, of 159,020 tons; and during her reign many measures adding to the strength and efficiency of the fleet were adopted. At her death, in 1714, there were 198 ships, 10,600 guns, 167,119 tons,—fewer vessels than at the beginning of her reign, but a tonnage larger by 8199. New dimensions for several classes of ships were established during the reign of George I., at whose death, in 1727, the navy consisted of 203 ships, of 170,862 tonnage. The wars during the reign of George II., and the signal successes achieved by the B. N., led to considerable augmentation of it. A scale of increased dimensions was established; and when that monarch died, in 1760, there were 412 ships, measuring 321,104 tons, the vote for the naval service of that year being £5,611,508, 51,645 sailors, and 18,355 marines. The progress of the navy during the long reign of George III. was unprecedented. The struggle with America and revolutionary France led to an immense increase of the B. N., the result being its undisputed sovereignty of the seas. From the commencement of hostilities with France in 1793 to the peace of 1815, the British took from their enemies 155 line-of-battle ships, and 586 smaller war-vessels; while their enemies took from them 5 of the former, and 151 of the latter class of war-ships.

Since 1815 the B. N. has been reconstructed by the building of larger ships, the introduction of steam power, and the adoption of armour-plated vessels. Many of these iron-clad ships revive an ancient mode of warfare by being used as 'rams'; the metal prows and screw propellers, however, are something infinitely more destructive than the beaked galleys of the ancients. (See RAM.) The most recent feature of naval reconstruction has been a decrease in the number of guns simultaneously with an enormous increase of their power and range. A heavy armour-plated war-sloop of the present day, it has been estimated, would be more than a match for a fleet of the class of first-rates known to Nelson. In the iron-clad fleet the heaviest guns and armour are carried by Turret Ships (q. v.).

The number of seamen and marines provided for the naval service of Great Britain in the estimates for 1873–74 was as follows:—Seamen, 34,000; boys, including 3000 for training, 7500; marines afloat, 8000; on shore, 6000—total, 55,000. For the coastguard, the officers and men on shore numbered in the estimates 4300; and 1200 were reckoned for Indian service. Adding these to the total given above, 61,000 officers and men were the *personnel* of the B. N. in 1874. In the same year the fleet consisted of 57 armour-plated vessels, about 300 steam and 170 sailing vessels—total, 527. The expenditure on the navy for the year ending March 31, 1874, was estimated at £9,872,725. As in the army, the naval force of the United Kingdom is recruited by voluntary enlistment. The men are divided into two classes, those who engage for ten years' continuous service, and those who volunteer for shorter periods, the former being paid at a higher rate.

The government of the navy is vested in the Board of Admiralty. It consists of five members:—The First Lord, who has supreme authority, all questions of importance being left to his decision; the Senior Naval Lord, who directs the movements of the fleet, and is responsible for its discipline; the Third Lord, who has the management of the dockyards, and superintends the building of ships; the Junior Naval Lord, who has to do with the victualling of the fleets and the transport department; and the Civil Lord, who is answerable for the accounts.

British Wine. See GINGER-WINE.

Britt'any. See BRETAGNE.

Brittlestar, a genus of starfishes (*Echinodermata*) included in the order *Ophiuroidea* of that class. They are distinguished from common starfishes by the fact that the viscera or organs of the body are confined to the central disc or body, and do not extend into the rays; whilst the ambulacral or 'walking' system of tube feet is rudimentary, and not adapted for locomotion. The brittlestars form the genus *Ophiocoma*, and the familiar species are the common B. (*O. rosula*), *O. neglecta* (the 'grey B.'), *O. punctata*, and *O. filiformis*. They derive their popular name from their curious habit of breaking off their rays when irritated or touched; and, from this peculiarity, it is a rare occurrence to secure a perfect specimen. The arms are five in number, and of simple form.

Brittlewort. See DIATOMACEÆ.

Britt'on, John, a topographical and antiquarian writer, born 7th July 1771, at Kingston-St-Michael, Wiltshire. Deprived of sufficient education by the death of his parents, he led a precarious life until he was engaged by the editor of the *Sporting Magazine* to prepare the *Beauties of Wiltshire*. After writing descriptions of other counties, B. devoted himself to producing magnificent illustrated works on old buildings in England and the Continent. His *chef-d'œuvre* is *The Cathedral Antiquities of England* (14 vols. 1814-35), with more than 300 plates. In all, B. produced nearly ninety works. He died 1st January 1857.

Brive-la-Gaillarde, a town in the department of Corrèze, France, on the left bank of the Corrèze, and on the railway between Bordeaux and Lyon, 15 miles S.W. from Sulle. It has a fine collegiate church, St Martin, of the 13th c., and is sometimes called the capital of the Bas-Limousin, at the S. base of which it lies, in a region fertile in fruits, wheat, maize, and wine. B. has an active export trade in millstones and slates. Pop. (1872) 8016.

Brixham, Upper and Lower, a market-town and seaport of Devonshire, England, on Tor Bay, 5 miles S. of Torquay. The Dartmouth and Torquay branch of the S. Devon Railway has a station at Brixham Road, two miles from the town. Its prosperity depends chiefly on its fisheries. Upwards of 200 vessels are engaged in trawling, and large quantities of turbot, sole, mackerel, and other fish are exported to London, Bristol, Exeter, &c. B. has also, however, a number of vessels engaged in coasting and foreign (chiefly Mediterranean) trade. Pop. (1871) 4941. B. is historically interesting as the landing-place of William of Orange, November 4, 1688.

Brisure', Brizé, Brisé, in heraldry, a difference or mark of cadency, indicating that a charge is broken.

Broach, or **Broche**, in architecture, is a term applied to a spire which springs direct from the tower without any intermediate parapet.

Broach. See BAROACH.

Broad Arrow (→) is the Government mark or stamp cut into or affixed to all solid material in dockyards and elsewhere belonging to the crown. The origin of the mark is not known. Any one in possession of goods so marked is liable in heavy penalties.

Broad-Bill. See SHOVELLER.

Broad'side, in a sea-fight, is the discharge at the same instant of all the guns along one side of a ship of war; and by the weight of shot and shell capable of being fired at one time the fighting power of a ship is sometimes estimated.

Broad'sword, a sword with a broad blade. Being used for cutting only, it has no sharp point for stabbing, like the sabre, and is very little used in the British army.

Brocade', a tissue of silk on which a damask figured pattern is woven. Brocades are chiefly used as an upholstery cloth for furniture and hangings.

Brooage. See BROKER.

Brooage Bonds are, in England, bonds by which a reward is stipulated for on account of the promotion of a particular marriage, by means of influence to be exerted over one of the parties. They are legally void, as being contrary to the freedom of marriage.

Brocc'oli, a garden variety of the common cabbage (*B. oleracea*), said originally to have been brought to Italy or other parts of Europe from the island of Cyprus in the 16th c. It is a variety of the Cauliflower (q. v.), differing from it in having coloured instead of white heads, and in having a deeper tinge of colour in the leaves. It is also cultivated in much the same way as the cauliflower. There are various varieties, the most esteemed of which, especially for late sowing and spring use, are the Cape broccolis.

Brochure' (Fr. *brocher*, to stitch), a word imported from the French, strictly denotes a small printed work, not bound, but only stitched together; but in England, at least, it is applied loosely to any publication bearing on a question of the day, whether bound or not.

Brock'en (Lat. *Mons Melibrocus*), the loftiest peak in the Hartz Mountains, situated in Stolberg-Wernigerode, Prussian Saxony, is popularly known as the Blocksberg (q. v.), and is a centre of German legend and fairy-tale. It is 3740 feet high, consists chiefly of granite, and has a wild, barren summit, from which in clear weather there is a splendid prospect. The well-known phenomenon of the *Brockengespenst*, or spectre of the B., is caused by the level light of sunrise or sunset throwing the shadow of intervening objects on the dense mist by which the peak is frequently veiled. At the base of the dome-like summit, and 3250 feet high, lies the *Brockensfeld*, an extensive morass, in which the rivers Bode, Ocker, Raday, and Oder take their rise.

Bro'haus, Friedrich Arnold, a great German publisher, born at Dortmund, formerly a free imperial town, now in the Prussian province of Westphalia, 4th May 1772. In 1808 he purchased the copyright of the *Conversations-Lexicon*, of which the first edition was completed in 1810, and the second in 1812. These were published at Altenburg. In 1817 he transferred his business to Leipzig where he was very prosperous. B. died 20th August 1823. He was an enlightened, patriotic and lovable man. The publishing business was carried on at first by his sons, **Friedrich B.**, born 23d September 1800, at Dortmund, and **Heinrich B.**, born 4th February 1804, at Amsterdam, along with Karl Ferdinand Bochmann (died 12th February 1852); but on the 1st of January 1850 Heinrich B. undertook the sole management and responsibility. He is assisted by his two sons, **Heinrich Eduard B.**, born 7th August 1829, and **Heinrich Rudolf B.**, born 16th July 1838, and has not only sustained, but even extended, the reputation of the firm. To him we owe the 10th and 11th editions of the *Conversations-Lexicon*, the former of which appeared in 1853-55, and the latter in 1864-68, with two supplementary volumes in 1872-73. **Hermann B.**, third son of Friedrich Arnold B., was born at Amsterdam, 28th January 1806, appointed Professor of Sanskrit at Leipzig (1841), and died there January 5, 1877. He wrote and edited many valuable works, and from 1856 was the editor of that colossal work, still unfinished, the *Allgemeine Encyclopädie* of Ersch and Gruber.

Brookville, a flourishing town in the Dominion of Canada, province of Ontario, and a station on the Grand Trunk Railway, lies on the left bank of the St Lawrence, 65 miles S. of Ottawa. It has extensive hardware manufactures. Pop. about 6500. All the steamers plying between Montreal, Kingston, Toronto, and Hamilton stop at B., and a steamer leaves daily for Chicago and intermediate ports.

Bro'die, Sir Benjamin Collins, a distinguished surgeon, was born June 9, 1783, at Winterslow, near Salisbury, Wiltshire, studied under Sir Everard Home at St George's Hospital,

where he subsequently became surgeon, was created a baronet in 1834, and appointed serjeant-surgeon to the Queen, and died 21st October 1862. B. is the author of *Lectures on Local Nervous Affections* (1837), *Lectures Illustrative of Subjects in Pathology and Surgery* (1840), *Psychological Inquiries as to Mental Faculties* (1854), and several other works. See *Autobiography of Sir B. B.* (Lond. 1865). His son, Sir B. O. B., born in 1817, was appointed Professor of Chemistry at Oxford in 1855, and has contributed several scientific papers to the *Philosophical Transactions*, and to the *Journal of the Chemical Society*.

Brodie, William, born at Banff, 22d January 1815, commenced modelling in Aberdeen in 1840, went to Edinburgh in 1846, and studied at the art schools there. He exhibited first in 1847, was elected Associate in 1852, and Academician in 1859. In his statues, busts, and imaginative subjects he has shown fine fancy and delicacy of treatment. Among his ideal statues are 'Corinna,' in the possession of Mrs Baird of Stitchesell; 'Cenone,' belonging to Lady Ashburton; 'Hecamede,' executed for Lord Taunton; 'Summer and Winter,' for J. Young, Esq. of Kelly, &c. Among his public statues are those of the late Prince Consort at Perth, Sir David Brewster and Sir James Y. Simpson at Edinburgh, the late Master of the Mint (Dr Graham) at Glasgow, &c.; while among his busts and portrait-statues are those of Her Majesty the Queen, Lady Kinnaid, Lord Barcaple, Sir Robert Christison, Dr Guthrie, and Principal Candlish.

Bro'dy, formerly *Lubnitz*, a thriving free town of E. Galicia, Austria, near the Russian frontier, with manufactures of leather and linen, and a large trade in the products of Poland, Russia, and Turkey. It is guarded by a castle. Pop. (1869) 18,743, of whom two-thirds are Jews.

Brog, Brogue, a rude kind of shoe formerly worn by the Celts of Ireland and Scotland. The term B. is also applied to the Irish pronunciation of the English language.

Brogliè, an ancient French family, originally from Quiers in Piedmont. It has produced many distinguished men, among whom may be reckoned several archbishops, bishops, governors, and three marshals of France. It was composed of four branches.—**Albéric de Broglio**, a famous captain of his time, after having captured the city of Assisi, left Turin, and fixed himself at Rimini, where he founded the first branch.—**Simon de Broglio** (dead before 1394) is the father of the three other branches, of which the first established itself in Provence, the second in Paris, and the third in Piedmont. To the last belongs the present Duc de B., though his family has been settled in France for some centuries.—**Albert, Duc de B.**, son of Achille Léonce Victor Charles, Duc de B., a politician of note in the reign of Louis Philippe, and grandson of Claude Victor, Prince de B., who was guillotined in 1794, was born at Paris, 13th June 1821, and at an early age made a name for himself as a political writer. He commenced as a contributor to the *Revue des Deux Mondes*, and was afterwards one of the chief writers in the *Correspondant*. Equally opposed to the one-sided doctrines of mediæval papistry and modern rationalism, autocracy, and democracy, he has been an able defender of Catholic interests and of moderate constitutional liberalism. His principal literary work is *L'Église et l'Empire Romain au 4me Siècle* (2 vols. Par. 1856). Two other works may be regarded as continuations of it, *Julien l'Apostate* and *Theodose le Grand*. He became the head of the family on the death of his father, January 25, 1870, and a political career was opened to him by the fall of Napoleon III. In 1872 he was appointed by M. Thiers French ambassador to London during the negotiations on the treaty of commerce, a post which he held only for two months. His latest work is *Le Secret du Roi: Correspondance Secrète de Louis XV. avec ses Agents Diplomatiques* (Par. 1878).

Broiling, a kind of rapid roasting process employed in the cooking of meat and the smaller white and cured fish. The process is conducted on a gridiron, called in Scotland a *brander*, hence the process in that country is generally known as 'brandering.' B. should be done over or in front of a bright, glowing fire of smokeless embers, and hence a coke fire is most suitable for the process. Meat cannot be broiled in large masses, and it is only rump steaks and chops, white or yellow haddocks, or whittings, and similar fish, that are generally prepared by the

process. The meat should be brought quite close to the fire, by which it is rapidly scorched on the surface, and frequently turned, either by turning the apparatus or with a small pair of tongs; but it should not be pierced with any instrument, as thereby the nutritive juices would be allowed to escape. In a very few minutes the meat is sufficiently cooked, and the process is thus a rapid means of procuring a savoury and nutritious meal.

Broken Knees (in horses), an injury or abrasion of the 'knee'—which, however, in reality is the horse's *carpus* or wrist—resulting generally from a fall or severe bruise. The injury naturally varies much in its character and in the effects which it leaves, as exhibited in the form of cicatrices or unsightly scars. The 'broken-kneed' or 'scarred' horse has thus a greatly depreciated value. The causes of this accident are due to whatever impairs the sure footing of the horse—such as imperfect shodding, stumbling on stones, &c. The treatment of this accident partakes of that adapted for ordinary contusions. Great attention should be paid to the thorough cleansing of the wound from particles of dirt, stones, &c. The wound is then to be washed with cold water, and to be bandaged with cold-water cloths, frequently renewed. If the joint has been opened into—the worst form of this injury—and a feverish condition ensues, a free purge, mashes, and low diet should be given, as in antiphlogistic treatment generally; whilst the wound should be poulticed to thoroughly clean it, if foreign bodies are still contained within the deep wound. During the later stages, and when the wound is healing, mild, stimulating, or astringent washes of zinc or copper sulphate, or of acetate of lead, should be used. The hair may sometimes be induced to grow on a cicatrix by using mild cantharidine ointment. B. K. constitute merely a blemish, and are not in law regarded as evidence of unsoundness.

Broken Wind (in horses), the name given to a functional affection of the breathing organs in horses, which seems to consist in a difficulty in respiration, probably depending upon some spasmodic affection of the larynx or bronchi. By some authors the affection is regarded as consisting chiefly in palpitation of the heart, whilst others refer it to a form of asthma with other respiratory complications. The *symptomatology* of the complaint is of obvious kind; the horse is generally thin, the abdominal muscles are relaxed, the respiration is quick, heavy, and laboured, and the muscular movements are irregular and spasmodic in their nature; cough is generally present, the pulse is rapid; the heart's action quick and enfeebled; and the entire aspect of the animal indicates a condition of prostration and weakness. The causes of the disorder are attributed to bad feeding and injudicious dietary. Coarse food given at improper times, by loading the stomach, and impeding digestion, together with inattention to watering, are said to be the chief causes. Low-bred horses are more subject to B. W. than high-bred ones. The treatment is limited to free purgation, careful attention to diet, and rest. Good oats, bruised, and in quantities of from 8 lbs. to 12 lbs. daily, with hay, form the curative dietary. Narcotics and sedatives (opium, camphor, &c.) do little or no good; and the modern treatment is therefore, at the best, only palliative. If left unheeded, congestion of the lungs, or even suffocation, may result. This disease constitutes legal unsoundness in the horse, and it is frequently temporarily and fraudulently disguised by giving the horse shot or lead in its meals preparatory to its being sold—the weight in the stomach, curiously enough, having an effect in temporarily mitigating the symptoms.

Broker is an agent who buys and sells shares and goods for others, being paid by commission, that is, a percentage on the value of the transaction. There are various kinds of brokers. 1. Those who act as agents for the sale of commodities or of stock in the public funds. 2. Shipbrokers (q. v.). 3. Insurance brokers, who negotiate between the merchant and freighter and the underwriter in settling for loss or damage. (See, under INSURANCE, *Maritime Insurance*.) 4. Sharebrokers, who transact business and effect transfers in shares in general. The laws, regulations, and mode of transacting business of this body are of much importance to the public. (See EXCHANGE, STOCK.) 5. Bill Brokers (q. v.). 6. Persons who appraise goods, sell or distrain furniture for rent, are called brokers, though their occupation is totally different from that of any of the former classes. The Fraudulent Trustees' Act, 20 and 21 Vict., c. 54, applies to brokers.

It inflicts penalties on those who appropriate funds intrusted to them.

Brokerage is the remuneration allowed to a Broker (q. v.). To stock and share brokers the usual allowance on our stock exchanges is at the rate of about 10s. per £100 on the value bought or sold. A shipbroker's charges are generally about 2 per cent. upon the gross receipts. An insurance broker charges 5 per cent. on the premium and $\frac{1}{2}$ per cent. deducted from claims recovered from the underwriters. See STOCK AND SHARE BROKER, SHIPBROKER, and INSURANCE BROKER.

Bromberg (Pol. *Bydgoszcz*, whence the Lat. *Bidgostia*), a town of Prussia, province of Posen, on the Brahe, 6 miles above its junction with the Vistula, and 60 miles N. E. of the city of Posen. It is a station on the Eastern Prussian Railway, and is also connected by rail with Warsaw. The *B. Canal* connects the Brahe and Netz. B. has manufactures of linen, woollens, tobacco, Prussian blue, &c.; also distilleries, breweries, corn-mills. In the 14th c. it was a very flourishing place, and after a period of decline is again rapidly rising. By the *Treaty of B.*, 16th November 1676, Poland surrendered the sovereignty of Plessen to Brandenburg. Pop. (1871) 27,734.

Brome's grass (*Bromus*), a genus of grasses allied to the Fescue (q. v.). There are many species, of which seven are natives of Britain. The soft brome (*B. mollis*) grows wild, and is eaten by cattle, but is little esteemed by farmers as a pasture-grass. Its seeds, as well as those of *B. purga* and *B. catharticus* (the first a native of N. America and the latter of Chili), are said to be deleterious, and the two latter emetic and purgative. *B. mollis* is a good grass for poor soil; and the same may be said of the smooth B. (*B. racemosus*), which, as well as *B. mollis*, is said to be a variety of *B. arvensis* (the field brome). The tall brome (*B. giganteus*) grows to the height of four or five feet, but is not much relished by cattle. Rye-like field brome (*B. secalinus*, perhaps also a variety, according to Bentham, of *B. arvensis*) is a troublesome weed, especially in rye-fields. Its seeds are erroneously said to be poisonous. Poultry are very fond of them.

Bromeliaceæ, a natural order of Monocotyledonous plants, mostly found in the tropics of America, W. Africa, and the E. Indies, though they appear to have been naturalised in many of the countries where they are now found from W. Africa and the E. Indies. There are about 180 species, and the order is important on account of the edible fruits and the useful fibrous material obtained from some of the species. *Ananassa sativa* is the Pine-Apple (q. v.). *Bilbergia tinctoria* of Brazil yields a yellow colouring agent from its roots. *Bromelia Pingium* is a vermiculiferous, and its leaves yield a good fibre. The juice of its fruits affords a cooling drink, given in the W. Indies, when mixed with water, to patients in fever and dysentery. *Tillandsia usneoides* is the Tree Beard or Old Man's Beard, so called from its dark fibres hanging from some of the S. American trees, like the *Usnea* and other northern lichens. It is imported under the name of Spanish or New Orleans moss, and is used, when mixed with horse-hair, for stuffing cushions, &c.

Bromine is the only element, except mercury or quicksilver, liquid at ordinary temperature. It was discovered by Balard (1826) in the mother liquors or *Bittern* (q. v.) of the salt-springs of Montpellier. Combined with sodium or magnesium, B. occurs in small quantities in sea-water, in certain mineral springs—especially in those of Theodorshall, near Kreuznach, in Prussia—in some specimens of Chile saltpetre, and along with iodides in *Kelp* (q. v.). *Bromide of silver* is occasionally found as a rare mineral in Mexico. B. is prepared either from *kelp* or from the bitter of the salt-springs. From either of these materials the chlorides and sulphates are got rid of as far as possible by fractional crystallisation, and the remaining liquor is distilled with a mixture of hydrochloric acid and biniodide of manganese, when B. accompanied by water passes over. In this process chlorine is produced by the action of the hydrochloric acid on the biniodide of manganese—

Biniodide of man- ganese.	Hydro- chloric acid.	Chloride of man- ganese.	Water.	Chlo- rine.
---------------------------------	----------------------------	--------------------------------	--------	----------------

and the chlorine thus produced displaces the B. contained in the metallic bromide—

Bromide of mag- nesium.	Chlo- rine.	Chloride of mag- nesium.	Brom- ine.
-------------------------------	----------------	--------------------------------	---------------

B. is a heavy red liquid (sp. gr. 2.9), having a peculiar and disagreeable odour, whence its name (*brōmos*, Gr. 'stink'). It readily volatilises, even at ordinary temperatures, as a deep red gas. It boils at 58° C., and solidifies to a grey metallic-looking mass at 22° C. B. combines with all the elements, and has a special affinity for hydrogen; it chars organised substances, and is an irritating and corrosive poison. Its most important compound is *bromide of potassium*, which is largely used in medicine as a sedative. The atomic weight of B. is 80, and its chemical symbol is Br.

Bromsebro, a village of Sweden, in the län of Calmar, 29 miles S.W. of Calmar, possesses a historical interest as the place where treaties were drawn up between Sweden and Denmark in 1541, 1641, and 1645.

Bromsgrove (earlier, *Bremesgrave*), a once prosperous but now declining market-town of Worcestershire, England, 11 miles N.E. of Worcester, in a beautiful valley near the Birmingham and Worcester Canal, and $1\frac{1}{2}$ miles from a station on the Birmingham and Bristol Railway. The chief industry is the manufacture of nails, needles, and buttons. Pop. (1871) 6967.

Bronchi are a continuation of the Trachea (q. v.), and are formed by the trachea or windpipe dividing into two—the right and left B.—one going to each lung. The right B. is the wider and shorter, being only one inch in length, whereas the left B. is two inches in length. The B. in structure resemble the trachea, being composed of rings of cartilage somewhat imperfect behind, bound together by fibrous tissue. The number of rings in the right B. is from six to eight, and in the left B. from nine to twelve. On entering the lung, the B. divide and re-divide, becoming smaller and smaller, until they ramify throughout the whole lung substance, and end in dilated sacs called the air cells of the lungs. (See LUNGS.) Through the B. the air is transmitted into all parts of the lung, and brought into close contact with the blood. See RESPIRATION.

Bronchitis, or inflammation of the lining membranes of the bronchial tubes, may be acute or chronic, may affect one or both lungs, the whole or only portion of a lung. It affects most frequently the upper lobes of the lung. *Acute B.* is a dangerous disease, the inflammation often extending to the lung tissue. The symptoms are fever, tightness about the chest, rapid breathing, wheezing, and cough. On coughing, a glairy mucus is expectorated, and afterwards the expectoration consists of purulent matter. The pulse is quick, the tongue foul, and often there is much constitutional disturbance. When B. is confined to the larger bronchi, the disease is not generally dangerous, but when it extends to the small air tubes (*capillary B.*), the disease is very serious and often fatal. *Capillary B.* is common in children, rare in middle life, and not unfrequent in the aged. B. is common in this country, and in all damp, cold climates. *Treatment*—confinement to bed in a warm room; steam is to be inhaled. Beef-tea, milk, and mucilaginous drinks are beneficial. At the outset an active purge often does good. Mustard to the chest, and some medicine which will produce free sweating, are often very valuable. Sometimes rubbing the chest with a liniment of croton oil or tartar emetic ointment will afford relief. Of internal medicines, ammonia, chloroform, squills, and senega are the best. *Chronic B.* is common in advanced life. Constant cough, shortness of breath, and abundant expectoration of mucus, not unfrequently very fetid, may be regarded as the chief symptoms. *Treatment*—chloroform, ammonia, senega, ipecacuan, squills, or turpentine in small doses. Cod-liver oil, stimulants, as wine and brandy, and good nourishing food, will often benefit the patient.

Bronchocele. See GOITRE.

Bründsted, Peter Oluf, a Danish antiquary and philologist, was born 17th November 1780, at Horsens, Jütland. He studied at Copenhagen, went in 1806 to Paris, and afterwards travelled in Italy and Greece. His excavations in Greece, executed in company with Haller von Hallerstein, Linckh, and Von Stackelberg, did much to illustrate classical antiquity, and an account

of his researches was published at Paris in 2 vols. 4to (1826-30), simultaneously in Danish and French. B. was appointed Professor of Greek at Copenhagen in 1815, and subsequently was appointed rector of the University, and died 26th June 1842, in consequence of a fall from his horse. His professorial lectures were published after his death (2 vols. Copenh. 1844).

Brongniart, Alexandre, a distinguished French mineralogist and geologist and naturalist, was born at Paris, 5th February 1770, and was appointed in 1800 director of the porcelain manufactory at Sèvres, which post he occupied till his death, which took place October 4, 1847. B. held other appointments. In 1818 he was appointed Chief Engineer of Mines, and in 1822 Professor of Mineralogy at the Natural History Museum of Paris. He and Cuvier worked together in some departments, and the result of their labours was B.'s *Essai sur la Géographie Minéralogique des Environs de Paris* (Par. 1811; new ed. with enlargements, 1822; 3d ed. 1835). Among his other works may be mentioned his *Essai d'une Classification des Reptiles* (Par. 1805), his *Traité Élémentaire de Minéralogie* (Par. 1807), and his *Traité des Arts Céramiques* (Par. 1845; 2d ed. 1854).—**B. Adolphe Théodore**, son of the preceding, and a foreign member of the Royal Society of London, was born in 1801, and was appointed Professor of Botany at the Muséum d'Histoire Naturelle, Paris, in 1833. He died at Paris, Feb. 19, 1876. His principal work is *Histoire des Végétaux Fossiles* (2 vols. Par. 1828-47).

Bronn, Heinrich Georg, a German naturalist, was born March 3, 1800, at Ziegelhausen, near Heidelberg, where he became professor in 1828. He died 5th July 1862. B.'s chief works are *System der urweltlichen Konchylien* (1824); *Leitha Geognostica* (1852-56, 6 vols. with atlas); *Geschichte der Natur* (1841-49); *Allgemeine Zoologie* (1850); and *Die Klassen und Ordnungen des Thierreichs* (1858).

Bron'te, a town of Sicily, in the province of Catania, at the foot of Mount Etna, in a rich wine district. has manufactures of cottons, woollens, oil, paper, &c. Pop. 11,800. In 1779 Lord Nelson was created Duke of B., with a yearly income of about £3750 (6000 *oncie*), by the Neapolitan Government.

Bron'te, Charlotte, the daughter of a clergyman of the Church of England, of Irish extraction, whose proper name was Prunty, was born at Thornton, in Yorkshire, 21st April 1816. In 1821 the family removed to Ilworth, and the parsonage of this little village was the scene of their sad domestic tragedy. In 1822, Mrs. B., and, a few years later, her two eldest daughters, died. The father was erratic and injudicious. The son's irregular life was the cause of hardship and anxiety. The three surviving daughters, Charlotte, Emily, and Anne, were constrained to endeavour to earn a livelihood by teaching, a struggle for which they were not well prepared. Charlotte had spent a year at Cowan Bridge School—afterwards introduced into *Jane Eyre* as Lowood—and two years at Roehead, under the kindly care of Miss Wooler. Their experience as governesses did not encourage them to persevere, and the sisters returned to their home at Haworth. In 1846 they published a volume of poems under the assumed names of Ellis, Acton, and Currer Bell, and immediately afterwards appeared *Jane Eyre*, *Wuthering Heights*, *Agnes Grey*, and *The Professor*. *Jane Eyre*, 'that masterwork of a great genius,' was at once almost a magical success. The author's heart was, however, saddened by the death of her brother, and of her sister Emily in 1848, and of Anne in the following year. In 1850 she paid a visit to London, of which Thackeray writes: 'New to the London world, she entered it with an independent, indomitable spirit of her own. She gave me the impression of being a very pure and lofty and high-minded person. A great and holy reverence of right and truth seemed to be with her always.' *Shirley* had appeared in 1849, and was followed in 1852 by *Villette*. In 1854, Charlotte was married to Mr. Nicholls, her father's curate, and died 31st March 1855. See *The Life of C. B.* by Mrs. Gaskell (Lond. 1857); a *Monograph* (Lond. 1876) by Wemyss Reid; a *Note on C. B.* (Lond. 1877) by A. C. Swinburne.

Bronze. Under the general denomination B. are included all the Alloys (q. v.) of copper and tin. The most important of these are *gun-metal*, *bell-metal*, *speculum-metal*, *B. for ornaments*, and *B. for coins*. The colour and other physical properties of the different bronzes vary with the proportion of the two

ingredients. As the quantity of tin increases, the alloy becomes harder and at the same time lighter in colour. In the manufacture of B. care must be taken to fuse the metal as rapidly as possible, otherwise the tin becomes oxidised and lost; and immediately before casting, the metal must be stirred to ensure uniformity of composition, and rapidly cooled in the mould, otherwise there is a danger of the ingredients separating from one another. The green colour, or *patina antiqua*, so highly prized on B. ornaments, is produced by the action of atmospheric air and moisture, but may be imitated by repeatedly washing the clean object with a solution of *sal ammoniac* and *salt of sorrel* in vinegar. B. has been known from early ages, and at one time was employed in the manufacture of almost every article now made of iron. That period has been called the *Bronze Age* (q. v.). The art of casting B. was first introduced by Theodoros and Roccos of Samos, about 700 B.C. The following shows the composition of the more important kinds of B. :—

	Copper.	Tin.
Copper coins of the present day . . .	95'0	4'0
Ancient sword-blade from Ireland . . .	91'4	8'4
Gun-metal	90'5	9'5
Bell-metal	78'0	22'0
Speculum metal	66'6	33'4

It should be remarked that B. for ornamental purposes is generally alloyed with small quantities of zinc, lead, and iron.

Bronze Age, the term applied by palæontologists and archæologists to the middle division of the human or recent period in geology, distinguished by the presence in the recent formations of instruments of bronze which were used by primitive or prehistoric man. This classification or division of the human period into the ages of Stone, Bronze, and Iron, is founded on the method employed by the Danish antiquaries. The term B. A. is rendered by the Danish *Broncealderen*. The researches incidental to the history of primitive man at this point are undertaken conjointly by the geologist and antiquary. The B. A., in Sir John Lubbock's classification of the human period (see his *Prehistoric Man*), would be included in his *Neolithic* division, or the newer epoch of the period. The instruments characteristic of the B. A., it is to be remarked, were not formed solely of that metal, since stone implements of improved shape are frequently found associated with the bronze ones, and indicate that whilst the use of metals was known and cultivated, the bronze implements did not wholly supersede the ruder stone weapons. The classification into the age of Stone, Bronze, and Iron, whilst a convenient one, is not therefore to be taken as strictly meaning that during these respective periods none but stone, bronze, and iron weapons were used. At the same time, the arrangement serves to show that an actual progress from the ruder stone to the fashioning of metals existed, and typified the rise of primitive man from rude barbarism to a semi-civilised state. In the peat-mosses of Denmark, especially in their newer or more recent portions, bronze implements occur, and in the later *Pfahlbauten*, or Swiss lake-dwellings, the B. A. is also represented by characteristic weapons. In British deposits, the progress from the Stone to the B. A. is less satisfactorily traced. See Chantre's *Age du Bronze* (4 vols. Par. 1877).

Bronze Wing, Bronze-Winged Pigeon, Bronze Pigeon, the popular names of certain kinds of pigeons in Australia, belonging to the family *Peristerina*, and natural order *Columbida*. The bronze-winged ground-dove (*Phaps* or *Columba chalcoptera*) is the most common species. It is about 15 inches long, and is found in most parts of Australia (except the extreme S.), as well as in some of the South Sea Islands. It frequents sandy spots, and is usually seen on the ground, though occasionally it perches on shrubs. It coos very loudly. Of the other species of B. P., the chief are the Little B. P. (*P. or C. elegans*), which has a more southerly range than *P. chalcoptera*, and frequents marshy places; and the Harlequin B. P. (*P. or C. histrionica*), found in the northern parts of New South Wales. See PARTRIDGE-PIGEON.

Bron'zing is a term used to denote the imparting of a bronze-like appearance to articles of metal, wood, plaster, &c., by means of bronze powders. Finely-divided gold forms an ingredient in some of the more expensive powders. *Copper powder* is prepared from a saturated nitrous acid solution of copper, by

inserting into the liquid small iron bars, which precipitate the copper in a pulverised state. *Gold size* is commonly applied to the article to be bronzed before laying on the powder, and to prepare it gum animi, in a fine state of division, is boiled with linseed oil, vermilion being added to render it opaque before use. In the process of B., the article is covered with gold size diluted with turpentine, and when nearly dry the powder is applied with a piece of soft leather as a brush; when quite dry the superfluous powder is wiped off. An agreeable reddish-brown colour may be communicated to copper medals and other articles by boiling them in vinegar containing two parts of verdigris and one part of sal-ammoniac. Peroxide of iron, made into a paste, with dilute solution of acetate of copper, rubbed over copper vessels, on heating, imparts to them a thin film of sub-oxide of copper, which greatly improves their appearance. Gun-barrels are browned with chloride or butter of antimony rubbed on the slightly-heated iron.

Brooch (Fr. *broche*, a spit or knitting-needle), an appendage of dress, at once useful and ornamental, composed essentially of a pin or skewer mounted in a ring, boss, or other metallic frame. The modern brooch is the representative of the *fibula* which was used by the ancient Romans. Brooches are, and have always been, made usually of gold or silver, worked in highly artistic patterns; and further, in modern times, they are set with jewels and precious stones. From their employment in fastening the cloak, mantle, or plaid at the neck or over the shoulder, they have been in all times a characteristic and essential ornament of both sexes of the Celtic races. Many interesting Celtic brooches belonging to prehistoric and to early Christian times are in public institutions, or kept as prized heirlooms in families, some of them showing wonderful artistic skill and workmanship. One of the most famous is the B. of Lorn, belonging to the

Lorn Brooch.

family of Macdougall of Lorn, which, tradition says, was left in the hands of a foeman by Robert Bruce when he was defeated at Methven.

Brooke, Henry, dramatist and novelist, was a native of Ireland, and was born in 1706 at Rantavon, in county Cavan. He was educated for the bar in London, where he became the friend of Swift, Pope, and Lyttleton. From an early age he had shown a faculty for making verses, and in 1732 published a poem called *Universal Beauty*, in which he was believed to have been assisted by Pope. His next work was the unequal drama of *Gustavus Vasa*, by which he made £1000. Returning to Ireland in 1740, he obtained the post of Barrack-master, wrote numerous books, and died in Dublin, 10th October 1783. The only one of his works which has survived to the present time is his novel of *The Fool of Quality*, of which the late Canon Kingsley published an edition in 1859.—Charlotte B., daughter of the preceding, was an enthusiastic student of the Irish

tongue, and published in 1789 *Reliques of Irish Poetry, consisting of Heroic Poems, Odes, Elegies, and Songs, translated into English Verse, with Notes Explanatory and Historical, and the Originals in the Irish Character*. She also edited an edition of her father's works and wrote his Life. Miss B. died 29th March 1793.

Brooke, Sir James, born at Benares, 29th April 1803, was educated at Norwich, and served some time in the Burmese war of 1822-24. Having resolved to attempt the suppression of piracy in the Malay Archipelago, in the inhabitants of which he had become interested, he set sail from London in October 1838, in his yacht *Royalist*, with a crew of seventeen seamen, a naturalist, and a surveyor, and reached Sarawak, in the N.W. of Borneo, in August 1839. The district was then disturbed by revolt against the Sultan Omar Ali-Sapudin, represented in Sarawak by the Rajah Muda Hassim. B. accordingly spent the next year in a voyage round the Gulf of Boni, in Celebes, where he obtained much interesting information, both geographical and bearing on the habits and institutions of the Bugis, Wajo, and Winhoka inhabitants. Returning to Sarawak in 1840, after a long negotiation, B. got himself appointed rajah, and immediately published a code, addressed to Malays, Dyaks, and Chinese, guaranteeing free communication and free trade (except in antimony), enforcing the *ondong-ondong* (or ancient written law of Borneo) against murder and other heinous crimes, and promising a currency. The Dyak customs of 'taking heads' and of Babuhid presented much difficulty. In 1843 the sultan made the cession of Sarawak perpetual. B.'s vigour in repressing piracy by 'head-money' created a feeling against him in England, which had disappeared when he visited this country in 1847, received the Order of the Bath, and was made Governor of Labuan, a post he held for many years along with his rajahship. In 1857 the Chinese, who had previously acted most dishonestly with reference to the antimony concessions, and who were now enraged by the restrictions on the opium trade, made a serious revolt, which, however, B. completely crushed. He then returned to England, and by lectures and deputations urged on Lord Derby's Government, as he had previously suggested to Sir R. Peel, that they should acquire Sarawak from him, and thus extend the treasures of coal they had found in Labuan, and open up a junk trade with China. The project was not entertained, although B. had made Sarawak a place of thriving trade, which, standing on the Indian-China steam-route, is destined to have great influence on the trade between Europe and China. B. was succeeded by his son as rajah, and died in England, 11th June 1868. See *Private Letters of Sir J. B.* (3 vols. Lond. 1853; the *Narrative of Captain Keppel*; and G. L. Jacob's *Rajah of Sarawak* (Lond. 2 vols. 1877).

Brooklime (*Veronica Baccabunga*), a species of Speedwell (q. v.), found in streams, ditches, and wet places in Britain. The leaves and young shoots are frequently used in salads, and sold with watercress. In Scotland it is sometimes called the *Water Paspie*.

Brooklyn, a city on Long Island, state of New York. It is separated from New York city by the East River, an arm of the sea connecting Long Island Sound with New York Harbour. It is named from Breuchelen ('broken land'), in Holland, and was first settled by the Dutch in 1625; but in 1800 its pop. was only 3298; in 1830 it was 15,292; in 1850, 96,850; in 1870, 396,105; and 1875, 482,687. B. has a bold bluff looking towards New York called the Heights, on which are many fine residences. A great many New Yorkers reside in B., and this accounts for the number of its churches, on account of which it is called the 'City of Churches.' It has a navy-yard covering 45 acres, besides possessing magnificent docks. B. has also many ferries across to New York, distant three-quarters of a mile. A lofty bridge is now being built to span the East River and join the two cities.

Brooks, Charles Shirley, journalist and litterateur, was the son of an architect, and was born at Brill, in Oxfordshire, about the year 1816. After leaving school, he was articled to an attorney, but soon took to literature as a profession. For a long time he wrote the 'parliamentary summary' for the *Morning Chronicle*, and otherwise contributed to that journal. He also produced plays, such as *Our New Governess*, and novels, of which *The Gordian Knot* and *Aspen Court* are among the most popular. B. was an active contributor to *Punch* from

its commencement, and succeeded the late Mr Mark Lemon as its editor in 1870. He died February 23, 1874. He was a singularly painstaking author and a genial man.

Broom, a popular name given to various closely-allied genera, *Genista*, *Cytisus*, and *Spartium*, of the natural order *Leguminosæ* (sub-order *Papilionaceæ*), but in Britain generally limited to the common B. (*Cytisus* or *Sarothamnus scoparius*). The twigs are bitter and nauseous, but powerfully diuretic, and are accordingly used in dropsy. The plant is also slightly laxative, and, in large doses, emetic. The genus *Cytisus* is a large one, extending over Europe and the Mediterranean region to the Canary Islands. The Irish B. of gardens (*C. patens*) is not a native of Ireland, but of Portugal. The Spanish B., also known as the B.-rush (though this name is usually reserved for *Viminaria*), is *Spartium junceum*; it possesses properties much the same as the common B. The Portugal or white B. (*C. albus*) is a native of the Mediterranean countries. Another white-flowered species cultivated in our shrubberies is *S. monospermum*, a native of the sandy coasts of Spain, and of Africa S. of the great desert. Like *C. albus*, its twigs, when beaten, steeped, and washed, yield a good fibre. There are various other cultivated species of B., many from the Canary Islands. African B. is a common name for *Aspalathus*; Dyer's B. is *Genista tinctoria*; New Zealand B., *Carmichaelia Australis*, &c.

Broom-Corn, a cultivated grass, probably a variety of the sorghum (*S. saccharatum*) from which sugar is manufactured. It is now extensively cultivated in N. America, into which it was introduced by Benjamin Franklin, for the purpose of making whisks or brooms from the tops of its stems and branches. Though originally brought from the E. Indies, it now flourishes in the United States, where the religious sect of Shakers devote much of their attention to its cultivation. In 1860, about 30,000 acres, chiefly in the states of Ohio, New York, and Illinois, were devoted to this crop—the value of the produce being about 1,390,000 dollars. Since then the acreage under broom-grass has much increased. See *Report of the Commission of Agriculture U.S.A.*, 1874.

Broom-Rape. See OROBANCHE.

Bro'ra Beds, a series of strata of the same age as the inferior oolite of Yorkshire, occurring at Brora, in Sutherlandshire, and its neighbourhood. One of the oldest known workable deposits of oolitic coal was opened there at the close of the 16th c. It is coal of fair quality, the seam being 3½ feet thick.

Bros'imum. See BREAD-NUTS, COW-TREF, and SNAKE-WOOD.

Brosses, Charles de, a French historian and archaeologist, born at Dijon, 17th June 1709. As the result of a visit to Italy, he published at Dijon, in 1750, *Lettres sur l'Etat Actuel de la Ville d'Herкуланum*, the earliest treatise on the subject. His *Traité de la Formation Mécanique des Langues* (2 vols. 1765) has been of essential value to subsequent investigators, though some of its hypotheses have not been accepted. Other works are *Histoire de Navigation aux Terres Australes* (2 vols. 1756), *Dissertation sur le Culte des Dieux Fétiches* (1760), and *Histoire du Septième Siècle de la République Romaine* (3 vols. Dijon, 1777). His attempts to supply the lacuna of Sallust from a recension of about 700 fragments which he had collected occupied a great portion of the life of B., but the work was not completed at his death, March 17, 1777. His was a busy life. In addition to his labours as an author, he performed the functions of a magistrate, was president of the Parliament of Dijon, a member of the Academy of Inscriptions, and carried on an extensive correspondence with the savans of the day. See Villemain's *Tableau de la Littérature au dix-huitième Siècle*. B.'s correspondence with Voltaire was published in 1836.

Broth, a kind of food prepared by boiling together fresh meat, culinary vegetables, and frequently barley or rice, in a large proportion of water, till the vegetables are perfectly soft, and in a condition to be easily assimilated. The principal vegetables used in B. are onions, leeks, green peas, carrots, and turnips; but cabbage and greens are also sometimes used, and in certain districts of Scotland 'kail' is made in which greens only is used. Two favourite dishes of Scotch nationality are hotchpotch, an *olla podrida* of vegetables with chopped mutton,

and cockie-leekie, a broth prepared from the flesh of fowls and leeks, to which the judicious add prunes for flavour.

Broth'erhoods, Religious, lay associations, instituted for pious and benevolent purposes, probably in imitation of the spiritual orders, were very numerous during the middle ages, especially in Italy—Rome alone having more than a hundred. Some came into existence and continued under the patronage of the Church, while others either did not seek her countenance, or lost it, and some even fell under her displeasure and were severely persecuted. Some of the best known are the Beguines (q. v.) and Beghards, the Brethren of the Cross,—of the Free Spirit,—of the Common Life,—of Alexius or the Lollards, &c.

Brothers and Sisters of Charity were associations at first of lay brothers and sisters for tending the sick and the destitute. The order of Brothers of Charity was founded at Seville in 1540 by the Portuguese João di Dio, afterwards canonised, and received the rule of St Augustine from Pope Pius V. 1572, and all the privileges of the mendicant orders in 1624, when it was divided into two congregations, a Spanish and an Italian one. The European brothers wear a black dress, those in America wear brown, and have a distinct General. The order of the Sisters of Charity was founded (1634) in France by Vincent de Paul, assisted by Madame le Gras. It was recognised by the Pope in 1655, and in 1685 had 224 convents. Nearly destroyed by the Revolution, the order was restored by Napoleon in 1807, and now does good service in supplying elementary education in rural France. Branches of the same order or associations very similar have also hospitals in most of the principal cities of Christendom.

Brothers, Law of Succession among. By the law of England, if A die, leaving no descendants, his father is his heir-at-law; but failing his father, A is succeeded by his eldest brother and his descendants; then comes A's next brother and descendants, and so on to the youngest brother and descendants. Failing these, then A is succeeded by his sisters equally as coparceners. In Scotland, the law is different. A would not be succeeded by his father; nor, unless A was the eldest son of his father, would he be succeeded by his oldest brother. He is in all cases succeeded by the brother immediately younger than himself, followed by that younger brother's descendants. On the exhaustion of A's younger brothers and descendants, A's immediately older brother and descendants come in, and so on up to A's eldest brother, who is the last of all in the succession. There is an exception, however, to this order of succession in Scotland, where the estate has been purchased by the deceased brother. In this case it is called *Conguest*, and it goes to the immediately elder brother, on whose death it goes according to ordinary rules. See INTESACY; STATUTES OF DISTRIBUTION; KIN, NEXT OF; SUCCESSION.

Brothers, Lay, an inferior class of monks, employed as servants in Monasteries (q. v.). Though not in holy orders, they were bound by monastic rules.

Brothers, Richard, a half-crazed visionary, born about 1760, attracted much attention by his warnings and prophecies. He styled himself the 'nephew of the Almighty and prince of the Hebrews, appointed to lead them to the land of Canaan,' and his chief writings were *A Revealed Knowledge of the Prophecies and Times* (1794) and *An Exposition of the Trinity* (1795). He was confined for some time in Newgate, and later in Bedlam, but was ultimately released, and died January 25, 1824.

Brougham, Henry, Baron Brougham and Vaux, a conspicuous lawyer and statesman, was born in Edinburgh, 19th September 1778. His father was Mr Henry Brougham, a member of an ancient Westmoreland family, and his mother, Eleonora Syme, a niece of Robertson the historian. B. was educated at the High School and University of Edinburgh, distinguishing himself in mathematics, and passed at the Scotch bar in 1800. He had, however, little or no practice in Edinburgh, and his most notable achievement there was helping Jeffrey, Sydney Smith, and Horner to start (1802) the *Edinburgh Review*, to which he became one of the most active and vigorous contributors, and on almost every subject under the sun. B., after waiting seven years in Edinburgh, betook himself to London, passed at Lincoln's Inn in 1808, and soon obtained a considerable practice,

attracting especial attention by an appearance he made at the bar of the House of Commons, where he appeared for some merchants of Liverpool to ask the repeal of the Orders in Council. Entering Parliament in 1810, he at once took a high place there as an orator, an advocate of political and social, more especially educational, reform, and as an opponent of the slave trade. By the manner in which, along with Denman, he conducted the defence of Queen Caroline (1820-21), he became for a time the most popular man in England. His boldness in this trial, however, excluded him from professional promotion until 1830, when he became Lord Chancellor in the reforming ministry of that year. In this post he distinguished himself as the pioneer of law reform, while his audacity and eloquence aided greatly in passing the Reform Act of 1832. On the fall of the ministry of which he was a member in 1834, he retired from office, and never returned to it, although his voice was frequently heard as the fearless advocate of progress and law reform, and the critic of all administrations. Outside of Parliament he continued to display that interest in social matters which he had shown as a member of the House of Commons, when he took a leading part in the establishment of the University of London, and in the starting of those mechanics' institutes which have done something (if not much) for the technical education of the country. Towards the close of his life many honours were bestowed upon him, among them being the honorary posts of Lord Rector of Glasgow University, and Chancellor of that of Edinburgh. B. died at Cannes, in the S. of France, May 7, 1868. He had married, in 1819, Mary Anne Eden, the granddaughter of a baronet in the county of Durham, by whom he had two daughters, who both died before their father. The peerage has descended to the family of a brother of Lord B. B.'s leading characteristic was his enormous energy. It showed itself in his oratory; he surpassed every speaker of his time in declamation and invective, and it must also be added in diffuseness and rhodomontade. It showed itself in his capacity for reading and writing vigorously about all, even the most abstruse subjects; he was equally at home in theology, metaphysics, and physical science. B. was a wonderful example of what can be done by a strong head, backed by an equally strong will, that sets itself to master a great variety of subjects. Nevertheless, it is more than doubtful if he has made a single original or important contribution to any of the sciences with which his fervent intellect grappled. His works (11 vols. 1868) were published by Messrs A. & C. Black, Edinburgh. See also *B.'s Autobiography*, published by the same firm under the title of *Life and Times* (3 vols. 1871).

Broughty-Ferry, a town of Forfarshire, 4 miles E. of Dundee, connected with Ferry-Port-on-Craig by a railway-ferry across the Firth of Tay, thus bringing the Dundee and Arbroath and Dundee and Forfar railways into conjunction with the Fife lines. An old castle, lately repaired for the defence of the Tay, stands on the shore. On the slope N.W. of the town are numerous fine villas, the residences of Dundee merchants and manufacturers. Pop. (1871) 5817.

Broussonetia, a genus of plants belonging to the natural order *Moraceæ* (q. v.). *B. papyrifera* (the paper mulberry) is used in China, Japan, &c., for the manufacture of paper. From its inner bark the South Sea Islanders make a kind of cloth.

Broussais, François Joseph Victor, a celebrated French physician, was born at St Malo, December 17, 1772. He was educated at Dinon, and after serving as naval and military surgeon, became Professor of Pathology at Paris in 1832. He was elected member of the Institute, and died at Vitry, November 17, 1838. B. called his doctrine *Médecine Physiologique*, and it was adopted by a school of physiologists. He regarded *irritability* as the fundamental property of all living animal tissues, and declared that every malady proceeded from an increase or diminution of that property. *Inflammation* was held to be the secret of functional and organic disorders; and for that, local phlebotomy was practised as a remedy. B.'s theory is now considered partial and extreme, but in France was widely prevalent. His chief works are *Histoire des Phlegmasies chroniques* (Par. 1808); *Examen de la Doctrine Médicale généralement adoptée* (1816), and *Traité de Physiologie appliquée à la Pathologie* (1822). See *Éloge de B.*, by Dubois d'Amiens, and *Histoire Critique de la Doctrine Physiologique de B.*, by Costez. B.'s son, **Ossimir B.**, born in 1803, is author of several memoirs supporting his father's views. He died in 1847.

Brown, a pigment formed of unequal proportions of red, blue, and yellow, the former being in excess. In painting, the minerals asphaltum, bistre, umber, terra di sienna, Mars B., Cassel earth, B. madder, &c., are employed either in a raw or burnt state. A B. colour is communicated to pottery and porcelain by chromate of iron or antimony, lead, and manganese. In dyeing and calico-printing, B. is produced from catechu, madder with mixture of iron and red liquor mordants, and with the aniline B. commercially termed *Bismark B.*

Brown, Charles Brookden, an American author, was born of a Quaker family, in Philadelphia, January 17, 1771; studied for the legal profession, but soon devoted himself exclusively to literature. In 1797 he published his first work, *Alcuin*, a dialogue on the rights of women. In 1798 followed *Wieland*. During the same year the city of New York was scourged with yellow fever, and B. bravely remained to nurse his friends, and to be himself prostrated by the plague. He afterwards embodied his experiences in *Arthur Mervyn*. B. had great facility in writing, and threw off *Ormond*, *Edgar Huntly*, *The Sleep-Walker*, *Clara Howard*, *Jane Talbot*, in rapid succession. In 1806 he brought out the first Annual Register in America. He died at Philadelphia, February 22, 1810.

B. had a morbid but rather powerful imagination, with a tendency to psychological romance. His works, once much admired both in his own country and in England, and undoubtedly exercising a certain impress on some American authors, have now 'fallen into the portion of weeds and outworn fables.'

Brown, Ford Madox, an English painter, at one time an ally of the pre-Raphaelites, born at Calais in 1821, was educated on the Continent, and exhibited two cartoons at Westminster Hall in 1844. His 'King Lear,' a work of wonderful power, feeling, and technical dexterity (1849), was followed by 'Chaucer at the Court of Edward III.' (1851), and 'Christ Washing Peter's Feet' (1852), both of which received the Liverpool prize of £50. An exhibition of B.'s works, which was opened in London in 1865, included, among many other pictures, 'The Last of England' (a work of fine pathos and humour, representing character and incident on board an emigrant ship passing the Dover cliffs), 'The Autumn Afternoon,' 'Work,' and 'Wilhelmus Nonquæstor;' and since that time his chief works have been 'The Coat of many Colours,' 'Romeo and Juliet,' 'Cordeia's Portion,' 'Don Juan,' and 'Jacopo Foscari.' His son, **Oliver Madox B.**, author of *Gabriel Denver* (1873), and a painter and *littérateur* of great talent and promise, died in 1874. His *Literary Remains* were published, with an accompanying memoir, by William Rossetti (2 vols. Lond. 1876).

Brown, John, of Haddington, was born in 1722, at Carpow, Abernethy, Perthshire. His father was in humble life and of limited acquirements, and the son spent but a short time at school. At the early age of eleven B. lost both his parents, and became a 'herd' under the charge of a pious shepherd named Ogilvie. In the midst of pastoral employments he prosecuted the study of Latin and Greek with untiring diligence. Then he became a pedlar, was afterwards a teacher, and studied philosophy and divinity under Ebenezer Erskine of the Secession Church. In June 1751 he was ordained over the Burgher Secession congregation in Haddington, and in 1768 was appointed Professor of Divinity in his denomination. He died 19th June 1787. B. was an ardent student, with a liberal passion for languages, and in the course of his life acquired a respectable knowledge of Arabic, Syriac, Persian, Ethiopic, French, German, Dutch, and Italian. He first appeared as an author in 1758, with an *Essay on the Confession of Faith*. Ten years later he published a *Dictionary of the Bible*, which plain people still find useful. In 1778 he produced *The Self-Interpreting Bible*, which has made his name a household word in Scotland, and in 1783 a *Concordance of the Bible*. B. wrote many other works which no longer merit notice; but his life and character are more than admirable. Though not a man of genius, or even of great intellect, he had excellent sense, pure feeling, and genuine piety. He was a typical Scot and Presbyterian, both in the circumscription of his mind and the strength of his convictions. Perhaps the greatest, certainly one of the most accomplished, of the Scotch Seceders, he has left a profound impression of his worth on the mind of the graver portion of the Scottish people.

Brown, John, D.D., grandson of the above, was born July 12, 1784, at Whitburn, Linlithgowshire, and was ordained minister of the Secession U.P. Church, Biggar, in 1806. Translated to Edinburgh in 1822, he was appointed Professor of Exegetical Theology to his denomination in 1834, an office which he continued to hold when the 'Secession' joined with the Relief (1847) to form the U.P. Church. He died October 13, 1858. B. was a man of fine, even noble, presence, had great power as a preacher, and gave a fresh impulse to the exegetical study of the Scriptures in Scotland. His best works are *The Resurrection of Life, Expository Discourses on the Epistles of Peter, on Galatians, and on Romans*. Two of his sons have attained distinction—(1) **John B.** (born 1810), author of *Homo Subcivica* (1858), containing, among other things, *Rab and his Friends*, a character sketch of singular power and pathos; (2) **A. Orum B.** now (1876) Professor of Chemistry in the University of Edinburgh.

Brown, Captain John, of Harper's Ferry insurrection, was born in Torrington, Conn., U.S., May 9, 1800. An enthusiast in the cause of anti-slavery, he went to Kansas in 1854. There he entered earnestly into the contest with the South, and had a son killed. He then came E., revolving some larger plans for freedom, and in October 1859 surprised the country by making an assault on the arsenal of Harper's Ferry, Virginia. B. had collected a force of seventeen whites and five blacks, and with this small force he captured the arsenal, but was soon overpowered. He was tried for high treason, and hung, December 2, 1859. There were moral elements of a high kind in B., and he became the prophet and hero of the impending conflict for the freedom of the blacks. See Greeley's *American Conflict* (1865).

Brown, Robert, son of Anthony B. of Folthorp, Rutland, was born at Northampton in 1549. He was educated at Corpus Christi College, Cambridge, and became a preacher and teacher at Islington. About 1580 he began to declaim against the polity and Liturgy of the Church of England, and founded an Independent church in Norwich. He was arrested, but his friend Cecil set him free. He then went to Holland and formed a church at Middleburgh. Returning to England in 1589, he entered the Church of England, and was presented to the rectory of Oundle in Northamptonshire in 1590; but his conformity was of short duration. After a long, turbulent, and, on the whole, discreditable career, he died in Northampton jail in 1630, whither he had been sent, at the age of eighty, for maltreating a constable. B. wrote a treatise on *Reformation*, and another on the *Life and Manners of True Christians*. He was the founder of the sect of 'Brownists,' who afterwards, under John Robinson, became the Independents or Puritans, and planted the New England Colonies. B. boasted that he had been thirty-two times in prison; but any merit there may be in this is destroyed by what Fuller tells us, that B. had a wife with whom he did not live, and drew the revenues of a church in which he did not preach.

Brown, Robert, a distinguished botanist, born at Montrose, 21st December 1773, and educated at Aberdeen and Edinburgh University. After serving as an army surgeon, he devoted himself solely to botany, and, as naturalist, accompanied an expedition sent to explore the Australian coast in 1801. On his return he brought with him nearly 4000 species of plants, many of which were absolutely new to botanists. Appointed librarian to the Linnean Society, he was elected F.R.S. in 1811, D.C.L. in 1832, and President of the Linnean Society in 1849. He died in London, June 10, 1858. B.'s botanical investigations and his contributions to the *Transactions* of various societies established his right to the title bestowed on him by Humboldt, '*Botanicorum facile princeps*.' Through B.'s example and influence the natural system of Jussieu was substituted for that of Linneus. Among his works are *Podromus Flora, Novae Hollandiæ*, and *General Remarks on the Botany of Terra Australis*.

Brown, Samuel, M.D., son of Samuel B., founder of itinerating libraries, and grandson of John B. of Haddington, was born in that town, February 23, 1817. He entered the Edinburgh University in 1832, and took the degree of M.D. in 1839. Having chosen chemistry for his life study, he aimed at reconstructing the science of atomics. In 1843 the chair of Chemistry in

Edinburgh University became vacant, and B., who was a candidate, unfortunately staked his success on proving the isomerism of carbon and silicon. Having failed in his experiments, he withdrew his application, and, with a certain sad sternness, devoted himself to a life of hopeless experiment in his laboratory at Portobello. He was cheered in his austere retirement by the friendship of Hamilton, Carlyle, Emerson, and De Quincey, and sometimes came forth to lecture on scientific subjects. He died of consumption, September 20, 1857. B. had a fine poetic and philosophic genius, which was never destined to find adequate expression on earth. His *Tragedy of Galileo* (1850) was unquestionably a failure; but the searching and subtle quality of his genius is visible in his *Lay Sermons on the Theory of Christianity* (1841-42), and in his *Lectures on the Atomic Theory*, and *Essays Scientific and Literary* (2 vols. Edinb. 1858).

Brown, Thomas, the well-known Scottish metaphysician, was born at Kirkcubrecht, in Kirkcudbright, January 9, 1778. He was educated in London, and in 1794 entered the University of Edinburgh, where he pursued various studies, and from which in 1803 he received the degree of M.D. He subsequently practised medicine for some years in partnership with Dr Gregory of Edinburgh; but his devotion to literature and philosophy led to his being selected, in 1810, as the colleague and successor of Dugald Stewart in the chair of Moral Philosophy in the University of Edinburgh. After filling this position for ten years, his health declined, and he died in London, April 2, 1820. His first work, entitled *Observations on the Zoonomia of Dr Darwin*, 'the almost unmatched work,' says Sir James Mackintosh, 'of a boy of nineteen,' appeared in 1798. This was followed in 1803 by two volumes of poems; and between 1814 and 1819 he published six poetical works, but his poetry was never popular. He was one of the founders of the *Edinburgh Review*, and wrote the article on Kant in the second number. His pamphlet on the Leslie controversy appeared in 1818, greatly enlarged as *An Inquiry into the Relation of Cause and Effect*. The work, however, by which he is best known is the *Lectures on the Philosophy of Mind*, delivered to his college class. They were hastily composed at first, and were not subsequently altered, but they were listened to with enthusiasm, and have passed through numerous editions. B. criticised and endeavoured to supersede the psychology of Reid and Stewart, insisting particularly that all the mental phenomena gave the mind itself existing in different states, that consciousness is merely a general name, expressive of the whole variety of our feelings, that our muscular frame is truly an organ of sense, that our knowledge of the primary qualities of matter is derived from a muscular affection, and that sensations and perceptions equally can be nothing else than they are felt to be. The lectures owe their chief charm to their acute analysis, refined feeling, and fervid, if somewhat florid, eloquence. B.'s Life was written by Dr Welsh, and a searching criticism of his contributions to philosophy is contained in Sir William Hamilton's *Discussions*.

Brown Coal, or Lignite, a variety of coal which may be considered to occupy an intermediate place between peat and bituminous coal, found in the more recent geological formations, and, indeed, restricted by some authorities to the products of Tertiary deposits. It is mostly of a yellowish or brown colour, and frequently retains a good deal of the structure and appearance of wood. Deposits of B. C. are widely distributed throughout the world, and those in Germany are of much industrial importance, as some of them yield on distillation a very large percentage of paraffin. B. C. is a highly hygroscopic substance, which depreciates its value as fuel. Excluding ash and water, the following is the composition of the B. C. of Bovey, Devonshire:—Carbon, 69.53; hydrogen, 5.91; oxygen and nitrogen, 24.56.

Brown Spar, a name applied by mineralogists more especially to those varieties of brown crystallised Dolomite (q. v.) which contain carbonate of iron. But generally B. S. is a magnesian carbonate of limestone tinged by oxide of iron and manganese. It is sometimes called *pearl spar*, owing to its pearly lustre.

Brown University, a flourishing institution in Providence, Rhode Island, U.S., was founded in 1764, under the name of Rhode Island College, being the seventh in point of age among the colleges of the United States. It afterwards received a large gift from Nicholas Brown, Esq., and took his name. B. U.

is under the control of the Baptists, but the professorships are open to all Protestants. E. G. Robinson, D.D., LL.D., is president (1875).

Browne, Charles Foster ('Artemus Ward'), was born at Waterford, Maine, U.S., about 1834, and began to write for the press while settled in Boston. Afterwards he went to Toledo and Cleveland, Ohio, where his letters, by 'Artemus Ward,' attracted attention. In 1860 he became a writer to *Vanity Fair*, a comic paper in New York, and subsequently lectured at Salt Lake City and California. In 1866 he came to London, lectured on the 'Mormons,' and wrote for *Punch*. He died at Southampton, March 6, 1867. B. was of an amiable character, and had great social qualities. His chief works are *Artemus Ward, his Book*, and *Artemus Ward among the Mormons*. Perhaps the most humorous chapters are those on the *Shakers*, and on *Sacrificing his Relatives for the War*. The crazy oddities of his spelling have induced fastidious critics to deny his humour, but it was really genuine, though not rich or deep.

Browne, Sir Thomas, one of our most original prose writers, was born at London, 19th October 1605. After studying at Winchester, Oxford, and on the Continent, he settled as a physician at Norwich, where he spent the rest of his life. During the civil wars and the Protectorate he remained in learned seclusion, indifferent to either party. He was knighted in 1671, and died on his birthday, 19th October 1682. B.'s chief works are *Religio Medici* (1642), *Pseudodoxia Epidemica, or Inquiry into Vulgar and Common Errors* (1646), *Hydriotaphia, or the Urn Burial*, and *The Garden of Cyrus* (1658). De Quincey ranks B. with Jeremy Taylor as the most rich and dazzling of rhetoricians. His writings contain passages of gorgeous eloquence and profound solemnity, but his style is encumbered by unique Latinisms and recondite allusions. His rich, sombre imagination loved to brood upon dim mysteries, antique grandeurs, fantastic oddities, and quaint, insoluble riddles. His gloomy meditations on life, death, time, and oblivion, are at once pathetic and impressive. The best account of B. is that in Bulwer Lytton's *Quarterly Essays*. A complete edition of B.'s works was published at London (4 vols. 1836).

Browne, William, a pastoral poet, was born at Tavistock, Devonshire, in 1590. He studied at Oxford and at the Temple, became tutor to the Earl of Carnarvon, and died at Ottery-St-Mary, Devonshire, in 1645. His works consist of *Britannia's Pastorals* (1613 and 1616), *The Shepherd's Pipe*, from which Milton is said to have borrowed in *Lycidas*, and *The Inner Temple Masque* (1620). B. was a follower of Spenser, whom he resembles in sensuous richness of description and diffuseness of style. In *Britannia's Pastorals*, which are written in heroic couplets, B. excels nearly all his contemporaries as a pleasing and truthful painter of English scenery. His works were edited by Davies (Lond. 1772), and are found in Anderson's *English Poets*. For a critical estimate of B., see Leigh Hunt's *Jar of Honey from Mount Hybla*.

Brownie, in Scotland a spirit corresponding to the English Puck or Robin Goodfellow, and the Irish Leprechaun. See FAIRIES.

Browning, Elizabeth Barrett, the greatest English poetess hitherto, born in London in 1809, was the most highly-educated and cultured woman of her time, and published a translation of the *Prometheus* of Æschylus in 1833. In 1838 appeared her *Seraphim and other Poems*, in the chief of which the artistic form is Greek, while the thought is Christian. Married to Robert Browning in 1846, she cultivated the poetic art with increased assiduity in subsequent years. Her later works are *Casa Guidi Windows* (1851), *Aurora Leigh* (1856), *Poems before Congress* (1860). She died at Florence, 29th June 1861. The first collected edition of her poems appeared as early as 1844; later and complete editions are those of 1850, 1853, and 1864-66. Her verse is remarkable at once for spontaneous tenderness and artistic ingenuity. Many of her lyrics and minor pieces are imperishable. Her *Letters* in 4 vols. appeared in 1877.

Browning, Robert, poet, was born at Camberwell in 1812, studied at London University, and published the dramatic poem of *Paracelsus* in 1835, which some praised, but few read. *Pippa Passes*, which appeared in 1842, obtained a kind of dim recognition from a perplexed public. In the interval B. attempted

to write for the stage, but the failure of *Strafford* (1837) and of *Sordello* (1839) showed him to be deficient in the constructive faculty. But in his *Men and Women* (1855) a wonderful power of analysing thought and passion, and a rapidity, certainty, and brightness of conception, are conspicuously shown. Those who place B. above Tennyson in point of genius find here the best evidence for their estimate. *Romances and Lyrics* (1845), and *A Soul's Tragedy* (1846), are less notable performances. There is much elaborate conceit in his later works, of which may be mentioned *Dramatis Personæ* (1864), *The Ring and the Book* (1868), *Balaustion's Adventure* (1871), *Prince Hohenstiel-Schwangau* (1871), *Fifine at the Fair* (1872), *Red Cotton Nightcap Country* (1873), *Aristophanes' Apology* (1875), and *The Inn Album* (1875), *La Saisiaz: the Two Poets of Croisic* (Lond. 1878) and *Dramatic Idylls* (1879), the last three of which contain some of B.'s finest and most powerful poetry.

Bruce, the surname of a celebrated Scotch family that took its rise in Robert de Bruis, a Norman knight who accompanied William the Conqueror to England. His grandson, also Robert de Brus, received from King David I. of Scotland a part of the lordship of Annandale, which, however, he gave up to his son Robert on the outbreak of the war between Stephen and Matilda, niece of the Scottish king. The Lord of Annandale had two sons—Robert, who died without issue, and William, whose son Robert, fourth Lord of Annandale, by marrying Isabel, second daughter of David, Earl of Huntingdon, younger brother of William the Lion, became the founder of the royal family of B. He died in 1245.

ROBERT DE B., LORD OF ANNANDALE, fifth Lord of Annandale, and competitor with John Baliol for the crown of Scotland, was born in 1210. During the minority of Alexander III., he was one of the fifteen regents of Scotland, and in 1290, when the throne became vacant by the death of Margaret, the 'Maiden of Norway,' he claimed it, as being the grandson, by his mother Isabel, of David, Earl of Huntingdon, younger brother of William the Lion. Edward I. decided in favour of Baliol, 1292. To escape the indignity of swearing fealty to his successful rival, B. resigned the lordship of Annandale to his son. He died at his castle of Lochmaben in 1295.

ROBERT DE B., EARL OF CARRICK, eldest son of the above, was a favourite of Edward I., and accompanied him to Palestine in 1269. In 1271 he married Martha Margaret, Countess of Carrick, and thus obtained the title by which he is known. He lived chiefly in England after Edward I. decided the Scotch succession against his father, and became Constable of Carlisle. He fought against Baliol when the latter revolted, and asked the crown, but was refused. His death took place in 1304.

ROBERT B., the greatest of the kings of Scotland, and son of Robert, Earl of Carrick, was born March 21, 1274, at (it is generally believed) Lochmaben. In 1296, as Earl of Carrick, he swore fealty to Edward I., and for many years occupied a somewhat doubtful position in Scotland, sometimes siding with the other Scotch leaders in their efforts to secure the independence of their country, and then returning to his allegiance to Edward. In 1306 a quarrel with John Comyn, commonly known as the Red Comyn, nephew of John Baliol, and a rival claimant of the throne, which ended in his stabbing him (4th February) in the church of the Minorite or Grey Friars, Dumfries, compelled him to draw the sword for his country, and throw away the scabbard. He publicly asserted his rights to the throne, and was crowned king at Scone (27th March). At first, however, misfortune attended his efforts. Defeated in Perthshire (18th June) by a superior English force under the Earl of Pembroke, and again in the wastes of Athole by Alexander Macdougall, Lord of Lorn, uncle of the Red Comyn, he was reduced to such straits that he had to take refuge during the winter in the island of Rathlin, off the N. coast of Ireland. His queen fell into the hands of the English, his estates were confiscated, he was excommunicated, and even believed to be dead. In the spring of 1307, however, he landed on the Carrick coast, and captured his own castle of Turnberry from the English. His followers now began to increase in numbers, and on May 10, 1307, he overthrew his former opponent, the Earl of Pembroke, at Loudon Hill. This was the first of a series of successes, which in five years cleared all Scotland, except a few fortresses, of the English. B. now retaliated on England by invading it, and reduced the Isle of Man. The decisive conflict of the war, however, did not take place till

1314, when Edward II., marching at the head of an enormous force, numbering, it is said, 100,000 men, to relieve Stirling Castle, held by Sir Philip Mowbray for England, was completely routed (24th June) on the field of Bannockburn, with the loss of 30,000 men, by the Scots, who numbered, including camp-followers, about 40,000, and whose king that day displayed all the skill of an accomplished commander, and all the reckless daring of a private soldier. The war did not end then. Several invasions of England had to take place, and Edward had to be beaten once again at Biland Abbey, Yorkshire, before a truce was agreed to; nor was it until March 4, 1328, in the reign of Edward III., that a final treaty was ratified by a Parliament at Northampton, which recognised the independence of Scotland and B.'s right to the throne. The iron frame of the king had, however, been wasted by years of hardship and struggle, and succumbed to the disease of leprosy. He died at Cardross Castle, on the northern bank of the Firth of Clyde, June 7, 1329, in the fifty-fifth year of his age, and twenty-third of his reign. He was succeeded by his son David, whose mother was his second wife, Elizabeth, daughter of Aymer de Burgh, Earl of Ulster. By his first wife, Isabella, daughter of Donald, Earl of Mar, he had a daughter, Marjory, who married Walter, High Steward of Scotland, and became the mother of Robert II. B.'s body was interred in the Abbey Church of Dunfermline, where his bones were discovered in 1818. His heart was delivered to his trusty follower, Sir James Douglas, to be taken to Palestine and buried in Jerusalem; but Douglas, falling in battle against the Moors in Spain, the heart was brought back to Scotland, and buried in the Monastery of Melrose. For everything relating to the career of B. we are indebted to Barbour (q. v.), whose work was at once accepted by his countrymen as a truthful narrative of the great struggle. See Burton's *History of Scotland*, Palgrave's *Documents illustrating the History of Scotland*, and Freeman's *Historical Essays* ('*Relations between the Crowns of England and Scotland*').

EDWARD B., the gallant but too impetuous brother of Robert I., distinguished himself greatly in the Scotch War of Independence. In 1315 he crossed with 6000 men from Ayr to Ireland, to assist the native *septs* or clans against the English, was crowned King of Ireland at Carrickfergus, and for a time more than held his own. He was defeated, however, at Athenree in 1316, and fell in battle near Dundalk, October 5, 1317.

DAVID B., son of King Robert B., succeeded him at the age of five in 1329, and, along with his wife Joanna, daughter of Edward II., was crowned king at Scone in 1331. Driven from the throne by Edward Baliol in 1333, he was sent for safety to France, whence he returned in 1342. Taking advantage of the absence of Edward III. in France, B. invaded England in 1346, but was defeated and taken prisoner at Neville's Cross, near Durham. He was not released till 1350, when he was ransomed for 100,000 marks. B. died February 22, 1371, in Edinburgh Castle.

Bruce, James, a famous traveller, was born at Kinnaird House, Stirlingshire, December 14, 1730, and educated at Harrow School and at Edinburgh University, where for some time he studied law. He did not, however, follow the profession, but in 1754 entered into partnership with a Mr Allan, a London wine merchant, whose daughter he married in the same year. Within a few months his wife died, and in 1758, by the death of his father, he succeeded to the Kinnaird estate. He withdrew from trade in 1761; was appointed consul-general at Algiers in 1763; remained there for nearly two years studying Oriental languages and medicine; and in 1768 set out to explore the Nile sources. After crossing the desert from Cairo to the Red Sea, and wandering for some time in Arabia Felix, he successfully traced the Bahr-el-Azrek (Blue Nile), then regarded as the main stream, to its source. He reached Gondar, the capital of Abyssinia, where in 1770 he captivated the Emperor by his skill in physic, and served for some time in the army, making his escape with difficulty after two years' residence. In 1773 he returned to England, and published his *Travels to Discover the Sources of the Nile in the Years 1763-73* (5 vols. 4to, 1790), containing much curious and startling information, received with a widespread incredulity which recent travel has shown to be unjust. B. died at Kinnaird, April 27, 1794.

Bruce, Michael, a Scottish poet, was born 27th March 1746, at Kinrosswood, Kinross-shire, of humble parentage. Destined for the ministry, he was educated in spite of poverty at

Edinburgh University; but died of consumption, 6th July 1767, at the age of twenty-one. His few poems are in a strain of chastened sadness; and his best-known, the 'Elegy,' written shortly before his death, has a pathos peculiarly affecting. The first edition was published by his friend Logan (Edinb. 1770), who unfortunately inserted some pieces of his own, and hence a controversy, not yet decided, regarding the authorship of one of the finest and most popular poems in the English language, *Ode to the Cuckoo*. See Grosart's edition of B.'s poems, with memoir (Edinb. 1865).

Brucea, a genus of shrubs belonging to the natural order *Simarubaceæ* (q. v.), though by some referred to the allied orders *Xanthoxylaceæ* (q. v.) and *Rutaceæ* (q. v.). The root of *B. quasiosides*, a native of the Himalayas, is used as a substitute for quassia. The leaves of *B. antidysenterica* of Abyssinia, and *B. Sumatrana* of the Indian Archipelago, China, &c., are said to be tonic, astringent, and useful in dysentery.

Bruch'sal ('the bridge over the Sal'), a walled town in the circle of Carlsruhe, Baden, on the Salbach, 25 miles S. of Heidelberg by rail. It has a considerable wine trade, and contains an old castle, a palace of the Grand Dukes of Baden, and a large reformatory and prison. Pop. (1873) 9762.

Bruceine is an Alkaloid (q. v.) contained along with strychnine in the different varieties of *strychnos*, and in considerable quantity unaccompanied by strychnine in the *false Angustura bark* (formerly supposed to be *Brucea antidysenterica*, whence the name of the alkaloid). B. is a colourless crystalline substance, and combines with acids to form crystalline salts. Its action on the animal economy is similar to that of strychnine, but is less energetic. A drop of nitric acid colours its solution deep red (difference between it and strychnine). Its chemical composition is expressed by the formula $C_{23}H_{25}N_3O_4$.

Brück'enau ('Brook-bridge'), a village of Bavaria, on the Sinn, 36 miles N.E. of Würzburg, noted for its baths, which are situated in a beautiful valley encircled with fine woods, 2 miles W. of the village. Pop. 1571.

Bruges ('the place of bridges'), a walled city, capital of the province of W. Flanders, Belgium, 8 miles from the sea, and 12 W. of Ostend by railway. It has been the see of a bishop since 1559, is oval shaped, and has broad streets, which wear, however, a semi-deserted appearance. A great part of B. dates from the middle ages, and its houses are often richly ornamented. Its notable public buildings are the Church of Notre Dame, which has a tower 400 feet high, and contains in one of its chapels the beautiful gilded statues of Charles the Bold and his daughter, wife of Maximilian; the Hospital of St John, in which are Memling's finest pictures; the cloth and flesh markets (the *Halles*), built in 1364, over which rises to a height of 348 feet the famous Belfry of B., with the finest peal of bells (forty-seven) in the world; the Gothic town-hall, of date 1377, the repository of a public library of 15,000 volumes and 580 MSS., the façade of which supports 48 statues of the Counts and Countesses of Flanders; the Craenenburg, now a tavern, where the Emperor Maximilian was imprisoned for six weeks in 1488; and the palace of the Counts of Flanders, built in 1534, and now used as archives. The Gothic Cathedral of St Sauveur, an interesting building of the 13th c., no longer exists. The B. Academy contains a rare collection of the works of Van Eyck, Memling, &c., and the town library is remarkable for numerous works printed by Colard Mansion, the teacher of Caxton. Within the town there are as many as 52 bridges—a circumstance from which it has taken its name, B. being a French form of the Dutch *brug* (Ger. *brücke*), 'a bridge.' B. formerly employed some 16,000 skilled artisans, and has still manufactures of linen, cottons, woollens, lace, sugar, spirits, leather, and tobacco. Its harbour, *Sijns* ('sluice'), lies 9 miles N.E., in Zeeland, on the Zwin, with which B. is connected by a canal navigable for large ships. B. is also one of the Belgian railway centres, and the place where the Ostend, Ghent, Ypres, Nieupoort, and Veurne canals converge. The women have always been famed for their beauty. Pop. (1870) 47,621, of whom about one-third are military. B. is supposed to have been a place of some note as early as the 3d c., and probably received the gospel from St Chrysolus. It was the capital of Flanders in the 7th c., and in the 12th c. had become a haven of importance. In the following century it was the

chief of the Hanse towns, and monopolised the English wool trade. It reached its greatest prosperity at the beginning of the 15th c., by which time it had become the foremost commercial city in the world, and had over 200,000 inhabitants. The splendid court of the Dukes of Burgundy was then held at B., and there also resided here as many as twenty foreign ambassadors. The subsequent decline of B. was partly due to the rise of Antwerp. In 1794 it fell into the hands of the French, returned to the Netherlands in 1815, and remained with Belgium in 1830. See Weale, *B. et ses Environs* (new ed. Brug. 1875).

Brugg, or **Bruck** ('the bridge'), a fortified town in the Swiss canton of Aargau, on the Aar, 10 miles N.E. of Aarau. In its vicinity is the Castle of Habsburg or Hapsburg, and the Abbey of Königsfelden, founded in 1310, in the vaults of which are buried many of the Austrian royal family. Pop. (1870) 1338. B. occupies the site of the ancient *Vindonissa*, one of the most important towns of the Alemanni, and later on an episcopal see, which disappeared during the devastations of the dark ages.

Brühl, an old walled town of Rhenish Prussia, about 9 miles S.S.W. from Cologne, has a splendid château, erected by Elector Clement Augustus of Bavaria in the beginning of the 18th c. Pop. (1872) 2293. Mazarin resided here after his banishment from France in 1651.

Brühl, Heinrich, Count von, favourite and prime minister of August III., King of Poland and Elector of Saxony, born at Weißenfels, 13th Aug. 1700, commenced life as a page at the court of Elizabeth, Duchess of Sachsen-Weissenfels. His engaging manners secured for him the patronage of August II. and August III. in succession, and in 1747 he became prime minister and factotum, to use Carlyle's expression, to the latter. He completely controlled the king by ministering, at the expense of the state, to his love of ease and luxury. He did not neglect to enrich himself, however, and maintained a retinue of 200 servants, and an establishment more magnificent than that of his master. He had a suit of clothes for every day of the year, and kept twelve tailors continually sewing for him. His reckless extravagance so exhausted the public finances, that the puny army he equipped for his master against Friedrich of Prussia was captured with its camp. Augustus and B. fled to Poland, carrying with them the pictures and the porcelain, but abandoning the national archives to the conqueror. B. died at Dresden, 28th October 1764. His library of 62,000 vols. (sold for 60,000 crowns) forms an important part of the royal library of Dresden. See Justi's *Leben und Character der Grafen von B.* (3 vols. 1760-64), and Carlyle's *Friedrich II.*, *passim*.

Brumaire (Lat. *bruma*, 'winter'), a month in the French Revolutionary calendar. On the celebrated 18th B. (November 9), 1799, Napoleon overthrew the Directory, and on the following day was proclaimed First Consul.

Brummel, Beau, a consummate dandy, who took society by storm in the early part of the present century, was born in 1778. He resolved to be the best-dressed man in London, devoted the most assiduous care to his toilet, and saw the fashionable world bow before his creaseless coat and artistic arrangement of cravat. For a time he rivalled in celebrity Lord Byron, who sarcastically pronounced him to be a very great man. He was intimate with the Regent, and was courted as an authority on matters peculiar to polite society; but, after ten years of social success, was ruined by gambling, and died in poverty and imbecility at Caen, 29th March 1840. He fully realised Carlyle's description of a dandy—'a man whose trade, office, and existence consists in the wearing of clothes.' His life was written by Captain Jesse (1844), and is a valuable satire on his times.

Brunck, Richard François Philippe, an eminent philologist, and a most subtle, though frequently rash, critic, was born at Strasburg, December 30, 1729. He was educated by the Jesuits, and took part for a time in the Seven Years' War, but subsequently returned to his native city, and ardently devoted himself to the study of the Greek authors, and to the emendation of their writings. His first work was the *Analecta Veterum Poetarum Græcorum* (1772-76); and he subsequently issued editions of Anacreon (1785), Apollonius Rhodius (1780), Aristophanes (1781-83), the *Poeta Gnomici* (1784), Virgil (1785), and Sophocles (1786-89), the last named being especially famous.

514

B. was for some time in prison during the French Revolution, in which he was engaged on the popular side. He died June 12, 1803.

Brune, Guillaume Marie Anne, a marshal of France, born at Brives-la-Gaillarde, March 13, 1763, and though of good family, was originally a printer, but rose to be one of the first generals of his time. In 1796 he was made general of brigade in the army of Italy under Napoleon, defeated the Swiss in 1798, established the Helvetic Republic, crushed the Anglo-Russian forces at Bergen, forced the Duke of York to capitulate on humiliating terms at Alkmaar, October 19, 1799, and vanquished the chiefs of the Vendée in 1800. He was appointed commander-in-chief of the army which entered Italy (1800) after the fall of Berne, and governor-general of the Hanse towns in 1806, but was disgraced for having omitted Napoleon's titles in the text of the treaty by which the island of Rugen was ceded by Sweden to France. After a long period of retirement, he joined Napoleon during the 'Hundred Days,' and took part in the battle of Waterloo. B. was put to death at Avignon, August 2, 1815, by an infuriated mob, on the false charge of being a 'terrorist of 1793.' See *La Vie du Maréchal B.* (Par. 1821).

Brunel, Sir Marc Isambard, a famous engineer, was born at Hacqueville, in Normandy, April 25, 1769. Educated for the Church, he early showed his passion for science, and was placed in the navy, as likely to prove a more congenial career. During the Revolution he was compelled to take refuge in America, where he supported himself as a civil engineer. In 1799 he came to England, and induced the Government to adopt his machinery for making ship-blocks, previously made by hand. This machinery was marvellously perfect and ingenious, and still remains in use. B.'s mechanical inventions were both very numerous and highly original. His greatest work, however, was the Thames Tunnel, to the carrying out of which (undaunted by two previous failures and abundance of evil prognostications) he devoted his best energies for many years. It was begun in 1824, and opened, after many difficulties, in 1843. B. was a Fellow, and afterwards a Vice-President, of the Royal Society, and was knighted in 1841. He died December 12, 1849. See Deamish's *Memoir of Sir Marc Isambard B.* (Lond. 1862).—**Isambard Kingdom B.**, son of the preceding, born at Portsmouth, 9th April 1806, became one of the most eminent engineers of his day. He assisted his father greatly in the construction of the Thames Tunnel. He became engineer of the Great Western Railway, and there introduced the broad gauge. He was the engineer of the *Great Western, Great Britain*, and *Great Eastern* steamships—each of them the largest vessels of their day—and was an early advocate of iron ships and screw propulsion. B. died 15th September 1859, his life having been shortened by over-exertion.

Brunelleschi, Filippo, an Italian architect, born at Florence in 1377. His genius was wonderfully versatile. He studied in turn painting, mathematics, mechanics, and perspective, the last of which he taught to Masaccio, the first painter who knew its principles scientifically. A careful study of the ruins of Rome filled him with the desire of reviving the architecture of the ancients; and when it was proposed in 1419 to complete the cathedral of Florence, B. suggested the construction of a cupola 130 feet in diameter, and 330 feet from the floor to the cross, a proposal considered at the time so impracticable that B. was regarded as a madman, but which he nevertheless succeeded in carrying into effect. The dome of St Peter's at Rome, executed a century and a half later by Michael Angelo, was a reproduction of the idea of B., who owed much of his success as an architect to his knowledge of mathematics. The churches of San Lorenzo and San Spirito at Florence are also striking testimonies to the originality of his genius. He died in 1444. See Quatremère de Quincy's *Vies des Architectes*.

Bru'ni, Leonardo, known as *Artino*, from being a native of Arezzo, was one of the famous Italian humanists who brought about the revival of Greek learning in Western Europe. Born in 1369, he devoted himself ardently to Greek literature, abandoning for it the study of jurisprudence. After having been secretary to four popes, he returned to Florence on the deposition of John XXIII., and was for the second time chancellor of the republic, at his death, 9th March 1444. His *Historia Florentina*, written in Latin, was printed at Strasburg in 1610, but an

Italian translation by Acciajuoli was published at Venice in 1473. His other works, which are numerous, are now almost forgotten. Among these are his *Commentarius Rerum suo Tempore Gestarum* (Ven. 1476); *Vite di Dante e del Petrarca* (Perugia, 1671), &c. B. translated into Latin Aristotle, Plutarch, and other Greek authors.

Brünn (Slav. *Brno*), the capital of Moravia, in the Austro-Hungarian empire, lies at the confluence of the Zvittawa and Schwarzwawa, 60 miles N. of Vienna by rail. The principal buildings are the cathedral, the Gothic church of St Jakob, with a tower 276 feet high, built 1318, a Protestant church erected in 1867, and a museum of antiquities. There are also many palaces, and to the west of B. stands the Spielberg (formerly the castle of the Markgraf), since 1740 a state prison, and still a citadel. It has important manufactures of woollens, cottons, silk, ribbons, leather, dye-stuffs, tobacco, soap, and glass. The town has fourteen suburbs. Pop. (Behm and Vagner, *Bevölkerung der Erde*, 1875) 73,771.

Brunnen, a village in the canton of Schwyz, Switzerland, at the S.E. bend of the Lake of Lucerne, and historically interesting as the place where the deputies of the Forest Cantons constituted their free commonwealth in 1315. Pop. (1870) 2274.

Brunnow, **Ernst Phil. von**, a distinguished Russian diplomatist of German origin, was born at Dresden, 31st August 1797. He began his studies at Leipsic in 1815, entered the Russian service in 1818, assisted at the congresses of Troppau and Laybach, was secretary to the embassy at London, and was present in the campaigns against the Turks in 1828 and 1829. In 1839 he was sent on a special mission to London, and accredited as ambassador in 1840. In July of this year he brought about a treaty with England on the Eastern question, and in 1849 was employed in settling the terms of the Navigation Treaty. B. was one of the representatives of Russia at the conference held at Paris in February 1856 to re-establish peace. After holding for some time the appointment of ambassador at Berlin, he was again sent in 1858 as Russian ambassador to London, and created a count by the Russian Emperor in April 1871. He died at Darmstadt, 11th April 1875.

Bruno, **Giordano**, a philosopher whose unhappy fate has added to his fame, was born at Nola in 1548. He was for some time a Dominican, but rejecting transubstantiation, he left the Church, and wandered through Geneva, Paris, England, Marburg, Frankfurt, &c., lecturing against the logic and physics of Aristotle, and maintaining the Copernican theory. In England (1583), where he composed his chief Italian works, he knew Sir Philip Sidney and was patronised by Queen Elizabeth. He describes Oxford in *Cena delle Ceneri*, or 'Evening Conversations on Ash Wednesday.' At Frankfurt (1588-90) he published three Latin works. On coming to Venice, he was denounced to the Inquisition, and sent to San Severina, the Grand Inquisitor at Rome. He submitted to the Church, and professed penitence as regards heresy on dogmatic points, distinguishing between metaphysical discussion and practical faith. But he would not retract his scientific doctrine of the plurality of worlds. In the Venetian account of the charge against B., it is said that he praised the Queen of England and other heretic sovereigns, and had written things concerning religion which were not becoming, even though he spake philosophically. After lying in the dungeons at Rome from 1593 to 1600, he was burned in the Campo di Fiora on 17th February of the latter year. B.'s contributions to pantheism are contained in his books *Della Causa Principio ed Uno* and *Del Infinito Universo e Mondi*. His deity is by necessity immanent in nature; and he has therefore been called the 'successor of the Neo-Platonists and the precursor of Spinoza' (Lewes). He opposes Pythagoras, Plato, and Lucretius to the authority of Aristotle. Among his lighter works, the aggressive satire against a 'superstitious orthodoxy without morality and without belief,' *Spaccio della Bestia Trionfante* (translated by Toland into English in 1713), is the most characteristic. B. employs humorous dialogue, and sometimes a sonnet, to advance his argument. The best edition of his works is that by Adolf Wagner (Leips. 1830). The most elaborate criticism is by Bartholinus (2 vols. Par. 1848). There is also a life by Berti (Flor. 1868).

Bruno, called *the Great*, Archbishop of Cologne and Duke of Lorraine, was son of Heinrich the Fowler, Emperor of Ger-

many. He was born in 925, and had for tutor Baldric, Bishop of Utrecht. B. was famed for his learning and piety, and wrote a *Commentary on the Evangelists* and *On the Life of Moses, Lives of Saints*, &c. The Emperor Otto I., his brother, made him Duke of Lorraine. He died at Rheims in 965.

Bruno, **St.**, was born at Cologne about the middle of the 11th c. Disgusted with the immorality of the times, he retired to a desert near Grenoble, called *Chartreuse*, and founded (1086) an order of monks—called, from the place, Carthusian (q. v.)—adopting the rule of St Benedict, with the addition of a number of very austere precepts. B. was invited to Rome in 1092 by Pope Urban II., but found the life there so little to his mind that he retired to the wilds of Calabria, where he established another monastery, and where he died in 1101. See *Le Père Tracy's Vie de Saint Bruno* (Par. 1786).

Brunswick, **Duchy of**, a N. German state, with an area of 1420 sq. miles, and a pop. (1871) of 312,170. It consists chiefly of three isolated portions—(1) the principality of Wolfenbüttel, subdivided into the circles of B., Wolfenbüttel, and Helmstedt; (2) the Harz and Weser region, subdivided into the circles of Gandersheim and Holzminden; and (3) the principality of Blankenburg, in the Lower Harz. There are also five small demesnes, the largest of which is Calvörde, in the Magdeburg territory. Wolfenbüttel, the most northerly part of B., is chiefly an elevated plateau, covered with elm and beech forests, and watered by the Oker. The other two divisions are traversed by the Harz Mountains, and contain the peaks Wormberg (3200 ft.) and Achtermannshöhe (2800 ft.). The Weser forms the boundary on the W. of Holzminden. Chief among the natural products are flax (yearly, 84,000 Ger. stones), hops, timber, potatoes, tobacco, and fruit. Silver, lead, copper, coal (near Helmstedt), and iron are extensively mined; and there are quarries of marble, alabaster, and limestone. The cities B. and Holzminden are the most active industrial centres, and the principal manufactures are yarn, linen, paper, glass, wooden wares, sugar, tobacco, and porcelain. There are also some ninety-six breweries, and many foundries and machine factories. The inhabitants are in great part of the 'Old Saxon' stock, to which also belonged in part the Low German conquerors of Britain. They are mainly Lutherans, there being besides (1872) only 7030 Catholics, 2793 adherents of the Reformed Church, 1171 Jews, and 574 members of small sects. There are over 400 village schools, six gymnasia, a university at Göttingen, and several technical and other schools. In 1873 there were throughout B. over 150 miles of railway, entirely the property of the state. B. is a limited monarchy by decrees of October 12, 1832, and November 22, 23, 1851, and the legislature is vested in the Duke and an elective assembly of forty-six deputies, elected for six years. The assembly only meets once every three years, a permanent committee of seven deputies being appointed to carry on the incidental business of the state, while the administration is in the hands of three ministers. It sends two members to the National Bundesrath, and three deputies to the Reichstag. The revenue for the triennial term 1873-75 was £433,381, and in 1873 the public debt amounted to £3,971,666, of which £1,321,110 has been contracted on railways.

B. formed part of Charlemagne's Saxon 'dukedom,' incorporated with the Frankish empire after years of hard fighting, and shared its fortunes, passing to the Guelphs of Swabia in 1137. Along with Lüneburg it remained the hereditary possession of Heinrich the Lion till his death in 1195. Otto, nephew of Otto IV. of Germany, and grandson of Heinrich the Lion, procured a grant from Friedrich II. by which B. was raised to a duchy in 1235. The sons of Otto, Johann and Albrecht, were respectively the founders of the *ältere Lüneburger* and *ältere Braunschweiger* lines, the former of which became extinct in 1369. The reigning house of B.-Wolfenbüttel was founded in 1569 by Heinrich, Duke of B.-Lüneburg-Dannenberg, and from his brother Wilhelm sprang the B.-Lüneburg line, which later became the house of Hanover (q. v.), and has given kings to Great Britain since the beginning of the 18th c. See the histories of Havemann (3 vols. Gött. 1853-37), Schaumann (Hanov. 1864), and Lambrecht (1874).

Brunswick (Ger. *Braunschweig*, 'Bruno's shed,' or town of B.), the capital of the duchy, on the Oker, in a fertile plain, 105 miles W.S.W. of Berlin, and directly connected by rail with

Hanover, Harzburg, and Magdeburg. B. has a Gothic town-hall, a handsome town-church, a Church of St Andrew, with a steeple 316 feet high, a medical college, a polytechnic school, a museum, and a theatre. In the principal public square are the statues of Heinrich the Lion and of Lessing, the latter by Rietschel. It has large manufactures of woollens, linens, beet-sugar, chicory, tobacco, and papier-mâché, while its beer (*munne*) is celebrated. Pop. (1871) 57,883, of whom 46,000 are Lutherans. B. was founded in 861 by Bruno, one of the early Dukes of Saxony, flourished as one of the original five towns of the Hanse League, but declined during the 15th c. It was conquered in 1671 by the Duke Rudolf August, and has been the residence of the ducal family since 1753. The Duke's palace, destroyed by fire in 1830, and again in 1865, was rebuilt in 1869, and is a beautiful edifice, with a quadrangle designed by Rietschel. See Dürre, *Geschichte B.s* (Biuns. 1861).

Brunswick Bay, the estuary of Prince Regent river, on the N. W. coast of Australia.

Brunswick Black, composed of lamp-black and turpentine, is employed for imparting a jet-black appearance to grates and other iron articles. A finer variety is called Berlin black.

Brunswick Green, a native earthy carbonate of copper, yielding a beautiful green colour, is employed in oil-painting under this name. Real B. G. is an oxychloride of copper, prepared by acting on that metal with hydrochloric acid; it has a pale bluish-green hue, and is useful in the arts.

Bru'sa, Brusa, or Bursa, capital of the vilayet of the same name, at the base of the Mysian Olympus. It is a clean town, with channels of water running through many of its streets. A mountain stream divides the Turkish from the Armenian quarter, while a ravine separates the latter from the Greek quarter. There are good bazaars, well stocked with Manchester and other European goods. Many of the houses are of wood, but there are several handsome buildings, the most remarkable of which is the great mosque. The environs are beautiful, the city standing on a slope facing a plain, variegated with mulberry plantations, gardens, clumps of cypress, kiosks, baths, &c. Its hot springs, famous in antiquity, are still used. Pop. estimated at 60,000, mostly Turks, though there are many Armenians, besides Greeks, Jews, and Franks. B. has an extensive trade in raw silk, and a striped satin is manufactured here, from which the under-garments of the Easterns is made. There is an important trade in corn, opium, and meerschaum clay, and its commerce is increasing. Its port is Gemlik. B. is the ancient *Prusa*, and is said by Strabo to have been built by Prusias, who carried on a war against Cæsar; but according to Pliny it was built by Hannibal. Its importance commenced after its capture, in 1326, by Orcan, son of Osman I., who made it the capital of the empire of the Osmanlis, which it remained for fully a century. The vilayet of B. has an area of 28,870 sq. miles; and a pop. of upwards of 1,000,000.

Brussels (Fr. *Bruxelles*, anc. *Brucosella*, 'the seat of the marsh'), the capital of Belgium, province of S. Brabant, on the Senne, a branch of the Dyle, lies partly on a hill and partly in a plain of great beauty. The modern or upper town is the residence of the higher classes, and has a fine park, the resort of the fashionable, of 18 acres, around which are situated many of the most notable buildings, such as the palaces of the King of the Belgians, of the Duke of Brabant, of the Prince of Orange (now the *Palais des Beaux Arts*), and the *Palais de Nation*, the house of the Legislature. In the low-lying part of B., inhabited chiefly by Flemish merchants and shopkeepers, there are many old and picturesque buildings. Among the chief public buildings of B. are the Palace of Industry, the Mint, the University (since 1834), the Academy of Science and Art, a fine cathedral of St. Michel and St. Gudule (13th c.), the new Exchange (1868-74), covering 3200 sq. metres; the National Bank, of date 1864; the town-hall, with a tower 373 feet high; the bazaar of St. Hubert, and the Hospital of St. John, with beds for 600 patients. The city also possesses a military school, a music conservatoire, a school of painting and architecture, a botanical school and garden, the royal library, including the Bibliothèque de Bourgogne, with 22,000 volumes, a picture-gallery, a valuable

museum, a *Hospice de Vieillards* for 700 inmates, splendid market buildings, and an astronomical observatory (1830). The old walls of B. have given place to pleasant boulevards, and the Allée Verte, a much-frequented avenue of lindens, leads to Laeken, a suburb (pop. 9200), where there is a royal castle, built in 1782, with a park and garden. Of the public squares of B., the most notable are the *Place Royale*, with a large statue of Godfrey de Bouillon; the *Place Michel* or *Place des Martyrs*, containing a monument to the 'martyrs' of 1830; the *Place Nationale*, where there is a statue of Leopold I., and the old Congress Hall, &c. The two principal streets are *Rue Royale* and *Rue de Madeleine*. Among the manufactures of B. may be mentioned point and Blondel lace, gold and silver wares, cottons, woollens, carriages, glass, and crystal, needles, hats, paper, and chemicals. B. has a great international trade, and is a commercial and railway centre. It has some twelve daily newspapers, of which the *Indépendance Belge* has a European reputation. To the W. lies Anderlecht (pop. 11,663) with large cotton factories and breweries. About one mile S. begins the Wood of Soignies, a splendid park, the *Bois de Boulogne* of B., 449 acres in extent, intersected by avenues and alleys. Between this park and the Dyle is the battlefield of June 1815, and three miles farther off lies the village of Waterloo (q. v.), in which there is now one of the largest beet-sugar factories in the country. Pop. (1873) 180,172, of whom 6000 were Protestants. Including nine suburbs, the pop. was 365,404. B. is first spoken of in chronicles of the 8th c. An established fact in its early history is the existence of a church here in 966. Otto II. held his court at B. in the 10th c., and the town was fortified in the century following. Its palace, built in 1300, was long the residence of the Dukes of Brabant, and in it Charles V. of Spain abdicated in favour of Philip II. in 1555. The subsequent cruelties of the Duke of Alba and the Inquisition, of which B. was the centre, drove some 10,000 of its citizens to seek refuge in England. During the Franco-Spanish wars of the 17th c. B. was more than once partly destroyed, but in later times made rapid progress in the peaceful reign of Maria Theresa. In 1792 it was taken by the French, who made it capital of the department of Dyle. B. was subsequently one of the capitals of the kingdom of the Netherlands, and was made the capital of Belgium at the Revolution of 1830.

Brussels Carpets. See CARPETS.

Brussels Sprouts, one of the cultivated varieties of the Cabbage (*Brassica oleracea*, q. v.). The 'sprouts' consist of little clusters of leaves which form miniature cabbages in the axils of the leaves. It is cultivated in much the same way as the cabbage. It is said to degenerate in Britain, and accordingly the seed, which is sown in February or March, is by some cultivators imported from Belgium.

Bru'tus, Lucius Junius, an early Roman hero, whose story is of a purely legendary character, was the supposed founder of the family of that name. He escaped death at the hands of his uncle Tarquin, the Proud, by feigning idiocy,—hence his surname, *Brutus*, or stupid. The oracle at Delphi intimated that he would take the place of his cousins, Titus and Aruns, as ruler at Rome. When Lucretia was killed by her father, after her foul outrage by Sextus, son of Tarquin, B. roused the people, obtained the banishment of the Tarquins, and was elected one of the first consuls. He put to death his two sons for taking part in a conspiracy to restore the Tarquins. He died fighting with Aruns, and the Roman matrons mourned him for a year.—**Marcus Junius B.** was born 85 B.C., and was educated under the care of his uncle and future father-in-law, Cato. B. joined Pompey at the outbreak of the civil war in B.C. 49; but after the battle of Pharsalia he submitted to Cæsar, and even served him, while Cato still stood out. By the influence of Cassius over his weak and vain nature, B. was prevailed upon to join the conspirators who murdered Cæsar, B.C. 44. When the feeling at Rome against the assassins became manifest, B. retired to the E., where, after passing some time at Athens, he took possession of Macedonia. Having by various means obtained men and money, he joined with Cassius to oppose the triumvirs, Octavianus, Antony, and Lepidus; but in the second battle of Philippi, B.C. 42, B. was defeated by Antony, and fell upon his own sword.—**Decimus Junius Albinus B.** served under Cæsar in Gaul, and was held by him in such esteem, that B.'s name

was found in his will as one of his heirs in the second degree. B., however, foully betrayed his generous patron, and took a leading part in his assassination. Thereafter he kept up for a short time a struggle with Antony for the province of Cisalpine Gaul. He was finally deserted by his soldiers, betrayed by Camillus, a Gaulish chief, and put to death by Antony's orders, 43 B.C.

Brüx, or Brix, a town of Bohemia, at the foot of the Schlossberg, on the Bila, 10 miles S.W. of Teplitz, with cotton manufactures. Near it are coal-mines, the mineral springs of Püllna and Seidlitz, and deposits of sulphate of magnesia. Pop. (1869) 6308.

Bruyère, Jean de la, a famous French author, was born at Dourdan, in Normandy, in 1644, where he held for some time the post of *Conseiller-trésorier*. Coming to Paris, he was, by the influence of Bossuet, appointed teacher of history to the Dauphin (Duke of Bourgoigne). He lived chiefly at Chantilly, Versailles, and the Hotel Condé. In 1687 he produced his celebrated *Les Caractères de Théophraste, traduits du Grec avec les Caractères, ou les Mœurs de ce Siècle*. The court society, under the Maintenon rule, afforded him abundant subject for satire, which he threw into the form of abstract delineations, under such titles as *La Belle, La Cour, Des Femmes, Des Esprits Forts*. His *Dialogues sur le Quietisme* were published in 1699. B. died 11th May 1696. See his Life by Sicard, prefixed to the Paris edition of 1827. His *Œuvres Complètes* (3 vols. 1878) form part of Hachette's splendid *Collection des Grands Écrivains de France*.

Bryant, Jacob, an English scholar, born at Plymouth in 1715, and educated at Cambridge. He became secretary to the Duke of Marlborough, whose tutor he had been; refused the Mastership of the Charterhouse that he might have leisure for study, and settled at Cypenham, near Windsor, where he spent nearly half a century in the toils and pleasures of literature. He died 14th November 1804. B.'s chief writings, which are more learned than critical, are *Analysis of Ancient Mythology* (1774-76), *Vindicia Flavianæ* (1776), *Dissertation Concerning the War of Troy* (1796), and *The Sentiments of Philo-Judæus Concerning the Logos* (1797). His last publication was *Dissertations on the Prophecy of Balaam; the Standing Still of the Sun at the Command of Joshua; the Victory of Samson over the Philistines*.

Bryant, William Cullen, the Nestor of American poets, was born at Cummington, county Hampshire, Massachusetts, U.S., November 3, 1794. He was the son of Peter B., a local physician; published translations from the Latin at ten, an original poem, *The Embargo*, at thirteen; and entered Williams' College, Massachusetts, at sixteen. Two years later he composed *Thanatopsis*, a poem of beautiful gravity, but pagan rather than Christian in its resignation to the universal doom. B. studied law, and practised in Great Barrington, Massachusetts, but in 1825 went to New York as an editor. In the following year he commenced his connection with the *Evening Post*, which he still controls. It was at that time on the Democratic side; in later years it has been Republican, but was always an advocate of free trade. The first collected edition of his poems appeared in 1832. In 1869 the veteran came forth with a metrical translation of the Iliad, and in 1871 of the Odyssey. His poetry gained him a high reputation not only in America but in Europe. Something of Wordsworth's love of nature, something of Hemans's tenderness of reflective sentiment, a classic purity of phrase, and a genuine love of the scenery and life of the New World, gave a fresh and peculiar charm to verse whose strongest point is not originality. In 1874 appeared *Among The Trees*; in 1877, at the age of eighty-three, he published a new poem, *The Flood of Tears*, in which the same note is struck as in *Thanatopsis*. B.'s latest prose work was a *Popular History of the United States* (vol. i., 1876). He died at New York, 12th June 1878.

Bryonia (*Bryonia*), a genus of plants belonging to the natural order Cucurbitaceæ. The only British species is *B. dioica* (the common B.), a frequent climber in the hedgerows of England, but not a native of Scotland or Ireland. The plant abounds in fetid, acrid juice, and is purgative and emetic. *B. alba* of middle Europe has similar properties, and the root of both is applied externally to bruises, and at one time was much in use as a cattle purgative, though unsafe from its uncertain and violent action. This is owing to the presence of a bitter extractive principle, *bryonin*. The young shoots of both species are eaten like asparagus. The fresh root is sold by herbalists under

the name of white B., or mandrake root; the true Mandrake Root (q. v.) is, however, that of *Mandragora officinalis*. In large doses it is poisonous. *B. Americana* and *B. Africana* have similar properties. The root of *B. epigea* is employed by the natives of India as an alterative in syphilis, &c., and is considered, though probably erroneously, a powerful remedy in snake-bites. The root of *B. Abyssinica* when boiled, can, it is said, be eaten with impunity. The so-called black B. is *Tamus communis*, an entirely different plant, belonging to the Yam order (*Dioscoreaceæ*). It has a large, fleshy, somewhat acrid root, which, like that of the true B., is sometimes applied externally to bruises. Internally it acts as a diuretic, and is also used as an emetic and cathartic. The shoots of this species and *T. cretica*, when boiled, can be eaten like asparagus. The seeds of *B. callosa* are used in India as a vermifuge, and yield an oil used in lamps.

Bryonia.

Bryophyllum, a genus of plants of the natural order Crassulaceæ (q. v.). *B. calycinum*, a shrubby succulent species, a native of the Moluccas, is remarkable for habitually producing buds on the edges of the leaves. These buds can produce independent plants. The bog orchid (*Malaxis paludosa*), and a variety of other plants, have also the same habit. In the Radick Islands the natives rear *Arum esculentum* by planting the leaves. The leaves of *Gloxinia Gesnera*, *Achimenes*, &c., will also produce plants if a notch is cut in the thick veins. Brown's *Manual*, pp. 181, 200, 369.

Bryozoa (Gr. *bruon*, moss; *zoon*, animal), the name formerly applied to the *Polyzoa*, a class of *Molluscoidea* or *Lower Mollusca*, represented by the *Flustra* or 'sea-mats,' and allied organisms (e.g., *Bowerbankia*, q. v.). The term was applied to these truly animal organisms from their generally plant-like conformation and form. See MOLLUSCA and POLYZOA.

Bryum, a genus of mosses, many of which are natives of Britain. They grow in dense patches, on wet rocks, wet earth, bark of trees, &c., and are among the most beautiful forms of their order.

Brzesk Litov'ski, a fortified town of Russia, government of Grodno, on the Bug, 108 miles S. of Grodno. Pop. (1867) 22,493, mainly Jews. From its position B. was always an object of contention between the Russians and Poles; and here in 1794 Suwarow defeated the Polish general Sierakowski. It has an active trade, and manufactures of leather and soap.

Brzezan, a town of Austrian Galicia, on the Lipagnita, 51 miles S.E. of Lemberg, has an old castle, and considerable leather manufactures. Pop. (1869) 7299.

Brzeziñy, or Brzesiñy, a town of Poland, government of Piotrkov, 62 miles S.W. of Warsaw, with some manufactures of woollen cloth. Pop. 6000.

Buaze', a S. African plant, of which no perfect specimen has yet reached Europe, but which is described by Livingstone as having a fibre finer and stronger than flax: a thread of it will cut the fingers rather than break.

Bubalus, or Bubalis, a genus of *Antelopes* (q. v.), inhabiting Barbary and N. Africa, and occasionally found in Egypt. The name B. is now scientifically employed to denote the Buffalo (q. v.) genus, the B. of the present article being similarly termed (*Antelope* or *Alcephalus bubalis*). It is popularly known in its native haunts as the 'Bekker-el-Wash,' or wild ox, and possesses an elongated head, with the ringed horns curved outwards, so as somewhat to resemble the prongs of a pitchfork. It is a gregarious animal. It averages a stag in size, and is coloured yellowish or light-brown, the tuft of the tail being coloured black.

Bubastis, an Egyptian goddess called Pasht, whom the Greeks identified with Artemis, was erroneously said to be the daughter of Osiris and Isis. The name B. is the Egyptian Pasht with the Coptic article prefixed, and the whole Græcised. The chief temple of the goddess was at Bubastis (q. v.). The animal sacred to B. was the cat.

Bubastis, an ancient Egyptian city, remains of which are found at *Tel Basta*, 'the mounds of Pasht,' so called from its high mounds, about 14 miles to the N. of Belbeys. B. is the *Pi-beseth* of Ezek. xxx. 17. The splendid temple of the goddess B. was here, and an annual procession was held in her honour.

Bubble, a name applied to any fraudulent or deceptive joint-stock project, started with an exaggerated prospectus of commercial success, for the purpose of enriching the promoters at the expense of the public. After the bursting of the South Sea Company (q. v.), the B. Act was passed with the hope of preventing similar swindles on the public. But difficulties in construing the Act led to its being repealed; and projectors of companies are now only amenable to common law.

Bubble-shell, a name popularly applied to the genus of *Gastropodous mollusca* known as *Bulla* (q. v.).

Bu'bo is the name given to inflammation of one of the glands of the groin. It may be a simple inflammation, or due to the absorption of some poison.

Bubo. See OWL.

Bucaniers, a maritime confederacy of English and French adventurers, banded against Spain and her American colonies from an early period in the 16th to the close of the 17th c. The word is derived from the Indian *boucan* (dried meat); *boucanier* thus meaning one who dries or smokes meat in the Indian fashion. At first restricted to certain settlers at Tortuga, the name was eventually applied to that strong piratical organisation which harassed Spanish power in the New World by sea and land. These 'brethren of the coast' had laws and commanders; and, from their unity of system, could inflict grave defeats on the Spaniards. Among their most distinguished captains were Montbar, a gentleman of France (called by the Spaniards *El Exterminador*); De Busco; Van Horn, a native of Ostend; and, greatest of all, Henry Morgan, by birth a Welshman. Under his leadership the B. performed their most renowned feat, the taking of Panama in 1670. Terrible atrocities stain the annals of these allied freebooters; but many of their exploits show a reckless daring which approaches the heroic. Among the last of the B. was the famous Dampier; but as the confederacy loosened, its character degenerated. The capture of Cartagena in 1697 was their final great achievement; and on the outbreak of war between England and France, and after the peace of Ryswick, this remarkable association broke up. Its remnant appeared in the vulgar pirates that continued to infest the Spanish main, and are hardly yet a thing of the past. See Dampier's *Voyages*, Burney and Thornberry's *Histories*, and the *Narratives* of Kingrove and Sharp.

Buoc'ari, a free haven of Croatia, Austria, on the Bay of Boccarizza, Gulf of Quarnero, 5 miles E.S.E. of Fiume, with ship-building, linen manufacture, and tunny fishing. It has a good trade in wine. In 1871 there entered the port 129 vessels of 7352 tons; cleared, 127 vessels of 7116 tons. Pop. (1869) 2119.

Buccina'tor, the name of a small thin muscle situated in the wall of the cheek. It is by the action of this muscle that the exit of air from the mouth is regulated when the mouth is filled with air, as in whistling or playing on a wind instrument; hence it is called 'trumpeter's muscle,' from *buccina*, a trumpet.

Buoc'ino, a town of S. Italy, province of Salerno, 33 miles E. of Salerno city, on the projected line of railway intended to connect Eboli and Potenza. Marble of a fine grain is quarried in the vicinity. Pop. 5493.

Bucci'num, the *Whelk* genus. See WHELK.

Buocleuch. The Scotts, Dukes of B., are one of the most ancient Border families of Scotland, tracing their descent as far back as the reign of Alexander III.; but the first who attained distinction was Sir Walter Scott of Branxholm, a Border chieftain whose name is well known to readers of Scottish minstrelsy, and who lived in the reign of James V. His son was in 1606 raised to the peerage as Lord B. Dignities and wealth poured in on the

family in numerous ways, till Anne of B. married the unfortunate James, Duke of Monmouth, and the pair were made Duke and Duchess of B. When her husband was beheaded in 1685, the Duchess retained her titles and estates. Her grandson Francis, who succeeded his grandfather, and who adhered to the name of Scott, succeeded to the title of Duke of B. on her death, married a daughter of James, second Duke of Queensberry, and obtained with her a portion of the Queensberry estates. His son Henry, whose tutor was Adam Smith, devoted great attention to the improvement of his estates and the amelioration of the position of his tenants, and was much esteemed in Scotland. The grandson of the latter, Walter Francis, fifth Duke of B., and present representative of the family, was born in 1806, and bears the titles of Duke of B. and Queensberry, Marquis of Dumfriesshire, Earl of Drumlanrig, &c., in Scotland, and Earl of Doncaster in England. His income from landed property in Scotland, which is situated in various counties, is larger than that of any other nobleman in the country. Like his grandfather, he is honourably noted for his exertions for the good of his tenants and the improvement of his property. Among the latter we may include the creation of the deep-water harbour and port of Granton, on the Firth of Forth, near Edinburgh, at a cost of £320,000. The Duke of B. was one of the chief patrons of Church livings in Scotland, but waived all claims to compensation when the Patronage Abolition Act of 1874 was passed. His eldest son, Walter Henry, late member of Parliament for the county of Midlothian, bears the courtesy title of Earl of Dalkeith.

Bu'centaur, the gorgeous state galley in which the Doge of Venice annually, on Ascension Day, 'married the Adriatic' by dropping a ring into the sea, and wedding it in the name of the republic. The ceremony arose in 1177 from an honour bestowed on the Doge Ziani, who defeated the fleet of Barbarossa.

Buceph'alus (Gr. *Bucephalus*, from *bucephalos*, 'bull-headed'), the favourite horse of Alexander the Great. Alexander, when a boy, tamed it, and, after carrying him through many victories, it died in India. Bucephalia, a town on the Hydaspes, was founded by Alexander in its memory.

Bu'cer, Martin, one of the most zealous fellow-labourers of Luther, was born at Schlettstadt, in Alsace, in 1491. His original name was *Kuh-horn*, of which B. is the Greek equivalent. At the age of fourteen he entered the Dominican order of monks; but, being converted to Protestantism by Luther, left it in 1521; after which he settled at Strasburg, where he became pastor and Professor of Theology. His talents for controversy and negotiation fitted him for occupying an important place in his party. He excelled in subtle distinctions, and was fertile in softened expressions to which each party could accommodate itself, and in flexible principles which favoured all. He thus played an important part in the controversy between Luther and Zwingli, seeking 'by exhortations, explanations, and perhaps also by shrouding the opinions of both parties in ambiguous language,' to mediate between the two, but without giving satisfaction to either party. In 1549 he was called to England by Cranmer, where he became Professor of Theology at Cambridge, and took part in helping forward the Reformation, along with Paul Fagius and other Reformers from the Continent. He died at Cambridge, 27th February 1551. Some years later his bones were exhumed and burned by order of Mary. A complete edition of B.'s writings in ten vols. was undertaken by Hubert, of which only one volume appeared (Basel, 1577). See Baum's *Biography of B.*, prefixed to an edition of his works published in 1858.

Bu'ceros, the genus of Hornbills (q. v.).

Buch, Leopold von, an illustrious German geologist and palæontologist, was born April 26, 1774, at Stolpe, in Prussia, educated at the Mining Academy of Freiberg, and travelled in pursuit of his science through Germany, Scandinavia, Great Britain, France, Italy, and the Canary Islands. He died at Berlin, March 4, 1853. His chief works are—*Geognost. Beobachtungen auf Reisen durch Deutschland und Italien* (2 vols. Berl. 1802-9); *Reise durch Norwegen und Lappland* (2 vols. Berl. 1810); *Ueber den Jura in Deutschland* (Berl. 1839); besides several monographs on ammonites and other fossils, and a beautiful geological chart of Germany in 42 sheets (2d ed. 1832). B.'s collected works were published in 1870.

Buch'an, the N.E. district of the county of Aberdeen, lying between the Ythan and the Doveran. The chief towns in it

are Fraserburgh and Peterhead. Some portions of the coast are very precipitous, and almost five miles to the S. of Peterhead are the famous Bullers of B., an immense well in the granite margin of the sea, into which the sea rushes by a natural archway, and in storms dashes up the sides with violence. B. was once an earldom of the old Scotch family of the Comyns, and remains of several castles belonging to them, as well as Druid circles, and the old Abbey of Deer, are still pointed out. It has developed a variety of the Aberdeen dialect of English, possessing a very respectable body of popular literature, and interesting from a philological point of view.

Buchanan, George, one of the greatest scholars of the 16th c., was born at the farmhouse of Moss, on the banks of the Blane, near Killearn, Stirlingshire, in February 1506. His father, Thomas B., belonged to an ancient family, but died in the flower of his age. His maternal uncle, James Heriot, sent him to the University of Paris at the early age of fourteen, where he remained for two years. In 1523, he served in the army of the Regent Albany, and took part in an invasion of England. Next year B. entered St Andrew's University, where he took the degree of B.A. in 1525. Soon after, he again proceeded to Paris, joined the Scots College in 1527, and graduated M.A. in 1528. Some time after he became Professor in the College of St Barbe, and tutor to the Earl of Cassillis. B., who was essentially a *humanist*—i.e., a lover of the exquisite literature of antiquity—was probably at no period of his life a devout Catholic; but about this time he seems to have privately adopted the doctrines of the Reformation; and, on his second return to Scotland (1537), after an absence of ten years, he composed, while residing in Ayrshire with his pupil, Gilbert, Earl of Cassillis, the *Somnium*, a poetical satire which gave mortal offence to the Franciscans, against whom it was directed. A new Erasmus appeared to be let loose on these solemn impostors, and their rage was so alarming that B. seriously thought of escaping to France. James V. stepped to the rescue, gave him one of his illegitimate sons (afterwards the famous Regent Moray) to educate, and instigated him to write his second satire, *Franciscanus*, which provoked such a storm of hate among the priesthood, that the King was unable or afraid to protect him; and in 1539 B. was forced to seek safety abroad. Cardinal Beaton, it is said, wished to have him assassinated. The truth is, the *Franciscanus* is obscenely abusive. B. now spent many years in Paris, Bordeaux, and Coimbra in Portugal, engaged in teaching, suffering much from the priests, but by his learning securing honour and protection from the great. While a prisoner in a Portuguese monastery on a charge of heresy, he translated the Psalms of David into Latin verse (*Psalmorum Davidis Paraphrasis Poetica*), a splendid triumph of the classic muse, which he afterwards dedicated to Queen Mary in verses that deserve their fame. During this third residence on the Continent, B. also composed his Latin tragedies on Jephtha and the Baptist, translated into the same tongue the Medea and Alcestis of Euripides, and wrote numerous odes and other poems. Restored to liberty in 1552, he first went to England, then back to France, and finally, in 1560, returned to his native country, which he never again quitted. B.'s fame as a brilliant scholar and poet preceded him. Mary, who admired genius, appointed him her classical tutor; but his religious politics rendered it impossible for him to be her friend. In 1566 he was made Principal of St Leonard's College, St Andrews, and in the following year Moderator of the General Assembly—the only layman that ever held that office. His *Detectio Mariæ Scotorum Regina*, dedicated to Queen Elizabeth, is rather an ignoble performance for a leal Scot, and, if its grossly slanderous contents were not concealed in a dead language, would even now evoke indignation. In 1570, B. was appointed tutor to the young king, James VI., and forced him, under penalties duly exacted, to receive a considerable share of learning. To James, B. dedicated his *De Jure Regni apud Scotos*, through which blows the keen air of classic liberalism. The last years of his life were spent in the composition of his *Rerum Scoticarum Historia*, on which his fame as an author chiefly rests. He died September 28, 1582. B. has long been reckoned the most exquisite Latinist of modern times, not only on account of the Augustan purity of his style, but also for the vitality and strength of genius which he threw into the ancient mould. Through him Scotland won a distinct and independent place in the learned world of Europe, and his name still awakens

admiration at home and abroad. The best editions of B.'s works are Ruddiman's (2 vols. Edinb. 1715) and Burman's (2 vols. Leyden, 1725).

Buchanan, James, the fifteenth President of the United States, was born in Franklin county, Penn., April 22, 1791. His father came from Donegal, Ireland. B. graduated at Dickinson College, studied law, was admitted to the bar November 17, 1812, and obtained a lucrative practice in the legal profession. He commenced political life as a Federalist, but became a Democrat under President Jackson. Entering Congress in 1820, he was appointed Minister to Russia in 1831, returned to the United States Senate in 1833, and opposed the rising anti-slavery agitation. President Pierce sent him to the English court, and he returned to assume the Presidency in 1857. His administration was disturbed with the troubles of Kansas, the Fugitive Slave Law, the John Brown raid, and the Southern Secession. B. tried to avert the storm by a peaceable policy, but failed; and his long success ended in eclipse. He died June 1, 1868.

Buchanites, a strange sect which arose in the W. of Scotland in 1783. Its founder was Elizabeth or Elspeth Simpson, born in Banff, 1738, of Scottish Episcopal family. She married Robert Buchan in Glasgow, who was a Burgher Seceder. In 1779 she began to prophesy the end of the world, and soon left her husband. At Irvine she became acquainted, in the year 1782, with the Rev. Hugh White, minister of the Relief Church there, who adopted her views. In May 1784 the people mobbed her house, and drove 'Lucky' Buchan and her followers from town. White, his wife, and others, male and female, and their mother in the Lord, forty-six in all, marched through Ayrshire to Nithsdale, and rested in a barn at New Cample, between Thornhill and Closeburn, all dwelling together. They were led out to a hill top to be translated, but returned to the barn, where they indulged in promiscuous sexual intercourse, and committed infanticide. At length some left, but others remained faithful. These took a farm in Kirkcudbrightshire, and built a house in Crochetford, where the last died in 1846, having the bones of the prophetess interred with him. Elspeth herself died in 1791. See Joseph Train's *Buchanites from First to Last* (Edinb. 1846).

Buchan-Ness (the 'nose' or promontory of Buchan), the most easterly point in Scotland, a promontory in the N.E. of Aberdeenshire, 3 miles S. of Peterhead, and 25 N. of Aberdeen, lat. 57° 28' N., long. 1° 46' W. The Buchan Deep is the name of a vast grove in the sea-bottom, 50 to 90 fathoms deep, and 25 miles broad, extending about seventy miles along the coast. On B.-N. stands a lighthouse 135 feet high.

Bucharest, or **Bukarest** (Wallach. *Bucuresti*, 'the city of delight'), the capital of Wallachia, and residence of the Princes of Roumania, on the Dembovitza, a feeder of the Danube, lies 36 miles W. of the shores of the Black Sea, and 244 N.N.W. of Constantinople. It is the see of a Greek archbishop, and has a university, founded in 1864, with a library of 26,000 vols., a museum, &c., and two public parks. B. is the centre of a great railway system from Russia and Poland by Galatz; from Constantinople by Varna and Rustchuk; from Austria by the Porte Orientale and Orsova on the Danube; from Hungary and Transylvania by Kronstadt on the Carpathians; and from the Black Sea by Kustendje and Tchernavoda in the Dobrudscha. B. is the chief resting-place between Pesth and Constantinople. It is 12 miles in circumference, ill-built, without sewers or water-works, and liable to severe attacks of typhus, diphtheria, and small-pox. A comprehensive Improvement Scheme planned by an English resident, Mr. J. W. Sheldon, was taken up by the Rumanian Government in 1878. B. carries on an active trade in grain, wool, cattle, timber, salt, wax, and honey, and is the entrepôt for the trade between Austria and the states that were formerly under Turkish sway. Pop. (1866) 141,754, many of whom are Germans. The treaty of B. between Russia and the Porte, signed May 28, 1812, gave to the former Bessarabia and part of Moldavia, and fixed the Pruth as the boundary between the two empires.

Buck, the term usually applied to the male Fallow Deer (q. v.), the female being named the 'doe.'

Buck-Bean, **Bog-Bean**, or **Marsh Trefoil** (*Menyanthes trifoliata*), a plant of the natural order *Gentianaceae*, found all over the colder parts of the northern hemisphere, and com-

mon in Britain. It grows in marshy places, and, with its beautiful flesh-coloured flowers with fringed petals, is one of the handsomest of British plants. From the bitter leaves is prepared an extract, which is tonic, astringent, and in large doses cathartic and emetic. Until lately it was admitted into the official pharmacopœia as a remedy in cases of dyspepsia and bowel complaints; at one time it was also used in intermittent fever. In some parts of Germany and Sweden it is sometimes used as a substitute for hops. The rhizome contains starch, which in Lapland is sometimes extracted and used as food.

Buckeye. See HORSE-CHESTNUT.

Buckhound, a variety of hound, so named from its being formerly much used in hunting the Buck (q. v.), or male fallow deer. The breed has of late years been much neglected. It resembles the Stag Hound (q. v.), but is of smaller size.

Buckingham, George Villiers, Duke of, favourite of James I. and Charles I., was the third son of Sir George Villiers, and born at his father's seat of Brookesley, Leicestershire, August 20, 1592. His handsome person attracted the attention of James I. shortly after the disgrace of his first favourite, Carr, and he soon became more than Carr had ever been. 'Steenie,' as James called him, and of whom the king was so fond that he used to loll on his neck and slobber his face with kisses, was in the course of two years elevated through all the ranks of the peerage, was made first Marquis and then Duke of B., and was appointed to innumerable offices, such as that of Lord Admiral of England, Master of the King's Bench Office, and Lord Warden of the Cinque Ports; and during the last years of the reign of James I., and the first of that of Charles I., was the sole director of the policy of Britain. Although the latest historian of this period, Mr S. R. Gardiner, has been able to show that B. was an abler man than was generally believed, his arrogance and luxury were intolerable. As a politician he was a failure, and he instilled into the mind of Charles I. notions which ruined him and his family. His ill-success (1623) in bringing about a marriage between the Infanta of Spain and Charles I., coupled with his ostentation and his lavish expenditure of the national treasures, roused the Commons, headed by Eliot and Pym, against him; he was impeached, and would have probably been brought to the scaffold, had not the king, who told B. he would die with him, dissolved Parliament. B. arranged the treaty of marriage between Charles and the Princess Henrietta Maria of France. He was disastrously beaten in an expedition for the relief of Rochelle in 1627, and when on the point of embarking on a second at Portsmouth, was stabbed to death by a discontented naval lieutenant, named John Felton, August 23, 1628. See S. R. Gardiner's *History of England under the Duke of Buckingham and Charles I.* (Lond. 1875).

Buckingham, George Villiers, Duke of, one of the wittiest, most versatile, and most profligate members of the court of Charles II., was the son of the preceding, and was born at Wallingford House, January 30, 1627. He studied at Cambridge, fought in the royal cause during the civil war, was present at the battles of Dunbar (1650) and Worcester (1651), and on venturing to make his appearance in London (1657) during the Protectorate of Cromwell, was thrown into prison, and only released on the abdication of Richard Cromwell. At the Restoration (1660), he recovered his estates, which had been confiscated, was made Master of the Horse, and by his wit and debauchery obtained a first place in the favour of Charles II. He was instrumental in bringing about the downfall of Clarendon, and formed one of the celebrated 'Cabal.' In 1666 he was disgraced for taking part in a conspiracy against the king, but was soon, by his address, restored to all his offices, and was made ambassador to France. He was engaged in the Popish plot, and assisted the Nonconformists in opposing the Test Act. On the death of Charles, B. retired to his mansion of Helmsley in Yorkshire. He died of a fever at Kirkby Moorside, April 16, 1688, and was buried in Westminster Abbey. With him became extinct the ducal branch of the old family of Villiers. The modern Dukes of Buckingham are Grenvilles. Besides being a politician and a debauchee, B. dabbled in chemistry, and wrote some poems and plays, of which last the best is *The Rhearsal*. B. is perhaps best known as being the original of *Zimri* in Dryden's *Absalom and Achitophel*.

Buckingham, James Silk, traveller and author, was born near Falmouth in 1786. After a chequered youth, he settled in Calcutta in 1816, and established the *Calcutta Daily Journal*. He secured the favour of the Marquis of Hastings, and his paper became successful. But on account of its severe censures of the Government it was at length confiscated, and B. returned to England. Here he started the *Athenæum*, and entered into various schemes and reforms. B. travelled extensively in Europe and America, and was unwearied in his efforts to give the world the benefit of his views; but he was something of a visionary, and his influence was transient. He sat in Parliament for Sheffield during 1832-37. B. died June 30, 1855.

Buckingham (Old Eng. *Buccingham*, 'the home or place of beech-trees'), the chief town of Buckinghamshire, on the Ouse, 61 miles N.W. of London by rail, with some manufactures of machinery, agricultural implements, manures, leather, straw-plait, and lace. It is almost encircled by the Ouse, which is here crossed by three bridges. The chief buildings are the parish church, built in 1780, and to which a fine Gothic chancel was added in 1866; a chantry chapel of the 13th c., used as a grammar-school since the reign of Edward VI., and repaired by Mr Gilbert Scott in 1588; and a fine Congregational church erected in 1857. B. is a very old place. It is mentioned in the *Chronicle* under date 918, and again in 1010. When Domesday Book was drawn up it was already a borough. The Earls of B., soon after the Norman conquest, built a castle here, and the family seat (Stowe) now lies about three miles to the N.W., being connected with the town by a fine avenue of trees which forms a favourite promenade. Pop. (1871) 7545. B. returns one member to Parliament.

Buckinghamshire, a county of England, in the basins of the Great Ouse and Thames, with an area of 738 sq. miles, or 467,009 acres, and a pop. (1871) of 175,879. It is one of the most fertile parts of the kingdom, has an undulating surface, is well wooded, and is watered by the Thames, Ouse, Ousel, Colne, and Thame. In the S. extend the Chiltern Hills, and in the N. there is much rising ground, while the centre is occupied by the rich vale of Aylesbury. The formation in the N. is Oolitic, and in the S. consists of greensand and chalk. Upward of two-thirds of the surface is cultivated, the chief crops being wheat, barley, oats, beans, and peas; and 1544 acres are occupied as orchards. There is much pasture, and in 1873 the number of cattle was 66,931; of horses, 15,923; of sheep, 288,341; of pigs, 43,301. The London market receives from B. a great quantity of wool, butter, cheese, and poultry. The towns Buckingham, Aylesbury, Marlow, and Wycombe are the chief seats in the county of the manufactures of paper, straw-plait, and thread-lace; and among the means of communication are the Great Western and the North-Western Railways, and the Grand Junction Canal. The county returns three members to Parliament, besides which five members are returned by the boroughs. In the reigns of Stephen and John, B. was the scene of the civil contest, though not of any event of special importance. It was also the headquarters for a time (1644) of the Royalist troops during the great struggle between Charles I. and his Parliament. Its antiquities are few, consisting chiefly of the remains of Nettle Abbey, now partly converted into a farmhouse; Burnham, Missenden, and Medmenham Abbeys, and the churches of Stewkley, Hianslope, Chetwode (containing some of the finest stained glass in the kingdom), Olney, and Chesham Bois. There are few traces of the baronial castle of feudal times, but the still older remains of several British and Roman roads exist.

Buckland, William, D.D., F.R.S., a distinguished geologist, was born at Axminster, Devonshire, in 1784, and studied at Oxford, where in 1818 he became Reader of Geology. In 1822 he received the Copley medal for his discoveries in the Kirkdale Cave, was President of the British Association in 1832, was appointed Dean of Westminster in 1845, and died August 14, 1856. His chief works are *Reliquia Diluviana* (1823), *Geology and Mineralogy Considered with Reference to Natural Theology* (1836), one of the Bridgewater Treatises (q. v.), and *Annals of Philosophy*.

Buckland, Francis Trevelyan, son of the preceding, born December 17, 1826, was educated at Winchester and Oxford, where he graduated B.A. in 1848. Having studied medicine.

and held for some time the post of House-Surgeon in St George's Hospital, he was appointed Assistant-Surgeon to the 2d Life Guards in 1854, but retired in 1863. He has made natural history a special study, and among his principal contributions to the advance of this branch of science are his *Curiosities of Natural History* (new series, Lond. 1866), and *Fish-Hatching* (Lond. 1863). B. was appointed Inspector of Salmon Fisheries for England and Wales, and in this office has laboured successfully for the naturalisation of British salmon in colonial waters, especially in those of New Zealand and Australia.

Bucklandia, a fine tree, with the general aspect of a poplar, belonging to the natural order *Hamamelidaceæ*, or witch-hazels. It is a native of the Himalayas, but might probably be naturalised in Britain (Hooker). It is named in honour of Dr Buckland the geologist.

Buckle, Henry Thomas, historian, was born at Lee, in Kent, 24th November 1823. His life was spent in intense study, its only remarkable feature being that he attended no school or university, but owed much to his mother. In 1857 he produced the first volume of *The History of Civilisation in England*, in which he considers the physical influences, such as food, climate, &c., which he regards as controlling statical conditions of national character, and the intellectual development of man, which he regards as the source and measure of progress. These principles are then verified by a general survey of the political and intellectual history of England, France, Spain, and Scotland, the whole forming merely the introduction to a projected history of English civilisation in detail. B. is remarkably skilful and accurate in his tableaux of important facts, but his capacity for just or sage inference is marred by an intense fanaticism, probably engendered by his cloistered training and solitary study. B.'s main principle—i.e., of the subordination of the physical, moral, and political condition of society to the state of the speculative faculties—was first clearly stated by J. S. Mill in the *Logic of Moral Science* (*Logic*, vi.). B. died at Damascus, 29th May 1862. A large collection of posthumous papers, with a Memoir of B., was published by Miss Taylor. See also *Pilgrim Memories* (Lond. 1874), in which Mr Stuart Glennie reports his conversations in the East with B.

Buckler, a shield worn or buckled on the left arm. The Roman B. was oblong, padded inside with sheepskin and linen, covered outside with metal plate. In the middle ages it was round, oval, or square, and generally was made of hide or wicker-work, strengthened in various ways with iron.

Buckles, fastenings for belts, straps, boots, and other articles of attire, besides harness, trunks, and many kinds of leather work. The essential part of a buckle consists of a tongue which rests on the upper side of a frame, through which the strap to be fastened passes, the fastening being made by the point of the tongue passing through a pierced hole in the strap. B. were a very fashionable appendage of shoes during the last century, and they were frequently costly and elaborate in make. They began to be first generally used on shoes in the time of William III., but occasional allusion is made to the fashion much earlier. In *Pierce the Ploughman's Crede*, a work of the 14th c., the Franciscans are denounced for their pride in wearing buckled shoes. The caprices of fashion still occasionally induce the wearing of buckled shoes by ladies, and gentlemen wear B. as a part of court dress.

Buckskin, a strong twilled woollen fabric for trouserings. The web is usually about 27 inches wide, and when finished the pile or nap is so short that the texture is seen through it.

Buckstone, John Baldwin, a clever dramatist and popular comedian, was born near London in 1802, took to the stage at the age of nineteen, and so rapid was his success, that in two years he became chief 'low comedian' at the Adelphi Theatre, while he also wrote such pieces as *Luke the Labourer*. Since then his career as an actor and writer of plays has been very successful. He carefully studies all his parts, and is without a rival as a representative of some of the best characters in Shakespeare and Sheridan. For upwards of twenty years B. has been lessee of the Haymarket Theatre. He has written an enormous number of pieces for the stage, of which some, such as the *Green Bushes*, *Good for Nothing*, and the *Irish Lion*, are still very popular. B. is treasurer of the General Theatrical Fund.

Buckthorn (*Rhamnus*), a genus of shrubs or small trees belonging to the natural order *Rhamnaceæ* (q. v.), very generally distributed over the world. The common B. (*R. catharticus*) is found over Europe, Russian Asia, and N. America, is not abundant in England or Ireland, and rare in Scotland. The bluish-black nauseous berries are violently purgative, but are rarely used in medicine. The alder B. (*R. frangula*) is more frequent than the common B., but still rare in Scotland. Like the former species, it was at one time used in medicine, and has been recommended in intermittent fevers. In addition to a bitter extractive principle, it contains a volatile oil with hydrocyanic acid, and a yellow colouring matter called *Rhamnin*; the berries are violently purgative. The wood is used, under the mistaken name of 'dog wood,' for making the fine light charcoal used by the gunpowder makers. The bark, leaves, and berries are used for dyeing. The unripe fruits of Dyer's B. (*R. infectorius*), and probably other species also of the S. of Europe, yield a brilliant yellow dye. The berries and inner bark of *R. tinctorius* of Hungary are also used for dyeing yellow, while the 'Chinese green indigo,' used in Lyon for dyeing silk, is prepared from the bark of *R. utilis* and *R. chlorophorus*. *French berries*, *Avignon berries*, or *yellow berries*, are the fruits of *R. infectorius*, *R. saxatilis*, *R. amygdalina*, and *R. Clusi*, and are used by the dyers. The sea-B. (*Hippophaë rhamnoides*) is a plant of another order (*Eleagnaceæ*). (See SALLOW THORN.) The evergreen *Alaternus* of our shrubberies is a species of B. (*R. alaternus*), a native of the S. of Europe.

Bucku, or **Buchu**, a name given to several species of the genus *Barosma* (natural order *Rutaceæ*), natives of the Cape of Good Hope. The leaves of several of them are aromatic, stimulant, anti-spasmodic, and diuretic, and exercise a specific influence on the urinary organs. Their properties are owing to a bitter principle (*Diosmin* or *Barosmin*), and a scented volatile oil. The species used in the pharmacopœia are *B. betulina*, *B. crenulata*, and *B. serratifolia*. The Hottentots perfume themselves with the leaves of B.

Buckwheat (*Fagopyrum*), a genus of plants of the natural order *Fagopyraceæ*. The fruit differs from that of *Polygonum* by not being enveloped in the perianth. The common B. (*F. esculentum*), is a native of Asia, but is now naturalised in many parts of Europe, where it is cultivated for the sake of its mealy seeds, which, when ground, form a nutritious meal, inferior to wheat, yet superior in feeding qualities to rice. In the United States it is largely employed as human food, but in Britain it is only grown to a small extent for the purpose of feeding pheasants (*Treasury of Botany*). Tartarian B. (*F. Tartaricum*) is a very productive species, a native of Siberia, and well adapted for growing in cold localities. Among other species may be mentioned *F. emarginatum* of China, *F. cymosum* of Nepal, and the common blackbire (*F. convolvulus*), a frequent weed in our cornfields. The ground seeds are familiar in the form of black specks in oatmeal.

Buckwheat.

Bucolic (from Gr. *boukolos*, 'a herdsman'), an epithet applied to pastoral poetry, first by the Greeks and afterwards by the Latins.

Buczac, an old town in Austrian Galicia, on the Strina, a tributary of the Dniester, 30 miles E.N.E. of Stanislavov, noted as the place where the treaty of peace between the Poles and Turks in 1672 was signed. Pop. (1869) 9763.

Bud, the form in which the flower or leaves exist previous to being expanded. There are therefore flower-buds and leaf-buds, the former being generally easily distinguishable externally by being rounded, while the latter are more elongated. Buds are *terminal* and *lateral*; the former, produced at the extremities of the branches or stem, serve to carry on the plant upwards or outwards; the latter, produced on the sides of the stem or branches, prolong the plant laterally in the form of

branches and branchlets. The latter are also called *axillary*, from being produced in the axils of leaves, though in reality both kinds are. Buds vary considerably in their nature and size, and even in the depth of winter the buds will serve to distinguish various trees and shrubs. In some cases they are naked, in others covered with scales, or with a gummy, waxy, or resinous exudation, which serve to protect them from rain; or in another case the interior is lined with a non-conducting kind of down or wool, which protects the young leaves and other structures from cold during the winter season. Most palms and other monocotyledons produce no lateral buds, and accordingly, if the terminal B. which prolongs the stem upwards is destroyed, the plant dies. Sometimes, as in the case of the lilac, there are two opposite terminal buds. The way leaves are folded up in the B. is called *præfoliation* or *vernation*, just as that of the flower-buds is *æstivation*, and a variety of names are applied to express this, and also the relation the different leaves in the B. bear to each other. The *eyes* of potatoes are subterranean leaf-buds produced on the tuber. Leaves in temperate climates begin to be formed in the axils of the leaves as soon as the young branches on which they are borne have been properly developed, but may never go beyond the rudimentary stage. In addition, there will occasionally appear *adventitious* buds on indeterminate portions of the stem, at the extremity of a medullary ray, or at a place where an incision is made in the bark, and thereby a determination of sap directed to the place; they will even appear on leaves, as in *Bryophyllum* (q. v.).

Bu'da (probably the Magyar form of the Slavic *Budin*, a 'hut' or 'dwelling,' though it is also said to have been called after Buda, the brother of Attila) is the name of a Hungarian city on the right bank of the Danube, connected with Pesth on the opposite bank by a suspension bridge 1246 feet long. B. is built round the Schlossberg, from the centre of which rises the fortress (*Festung*), enclosing the royal palace, the Church of the Assumption, and the public offices. To the S. of this rises the Blocksberg, which is strongly fortified. B. has six suburbs, Raizenstadt or Tabán, Christenstadt, Landstrasse, Neustift, Wasserstadt, and Alt-Ofen (*Aquincum*), a market-town of 16,000 inhabitants, which since 1850 has been incorporated with B., and where are the dockyards and building-yards of the Danube Steam Navigation Company. In addition to the public buildings already mentioned, there are sixteen churches, five monasteries, the arsenal, theatre, &c. South of the Schlossberg is the Josephsberg, containing the grave of the Turkish dervish Gül Baba, with a mosque, to which pilgrims from Turkey and Persia still repair. A Gothic monument has been erected to the memory of General Hentzi, who fell in defence of the town in 1849. B. has numerous charitable institutions. At the foot of the Blocksberg are several hot sulphur-springs, Bruckbad, Raizenbad, Blocksbad; Kaiserbad to the N., and Königsbad, the Roman *Aque calidae superiores*, in Wasserstadt. From one of these, with a temperature of 117° F., is derived the German name of the town, *Ofen* (oven). B. has a trade in silk and leather, and has spinning-mills and machine-works. But the principal industry is the manufacture of wine, the vineyards in the neighbourhood producing the celebrated 'Ofenerwein,' to the amount of nearly 5,000,000 gallons annually. Pop. 53,998, of whom 46,979 are Roman Catholics and 2554 Jews.

B. was at first a Roman colony. The present town grew round the castle, built in 1247 by King Bela IV. During 300 years it suffered twenty sieges, and it was in the hands of the Turks from 1541 to 1686, in which year it was wrested from them by Karl of Lorraine. It again suffered severely in the Hungarian revolt of 1848-49.

Budé'sus, or **Bude'sus** (the Latinised form of the name *Budé*), the most learned Frenchman of his time, and the friend and rival of Erasmus, was born at Paris in 1467. His early education was defective, but at the age of twenty-three he conceived an ardent desire for study, and became profoundly versed in Greek, then almost unknown in France. B. was patronised by three monarchs in succession. Charles VIII. made him one of his secretaries; Louis XII. made him a member of a legation to Rome on the accession of Pope Julius II.; and it was to the influence of B. with François I., whom he accompanied on his travels, that the College of France owes its foundation. He had also charge of the royal library. He

died 23d August 1540. It is pretty clear that B. was of doubtful orthodoxy. He was wont to speak contemptuously of the doctors of the Sorbonne, and his widow and children went over to the Reformed faith. B.'s first works were translations from Greek into Latin, and it was not till 1514 that he laid the foundation of his great scholastic reputation by the publication at Paris of his treatise *De Asse et Partibus ejus*, which was followed in 1519 by his *Commentarii Lingua Græca*. He wrote fifty-six letters in Greek, which were translated into Latin in 1574. His collected works were published at Bâle in 1557, in 4 vols. fol. The fourth vol. contains his Greek commentaries. B. left in MS. a Greek-Latin lexicon, which was printed at Geneva in 1554, and again in 1562, and assisted Henry Stephens considerably in the compilation of his *Thesaurus*. See *Vie de Budé*, by Leroy (1541).

Buda'on, a town of British India, in the Rohilkund division of the N.W. Province, on a small tributary of the Ganges, 140 miles N.W. of Lucknow and 30 E. of Allepgurh. During the Mutiny the Europeans were forced to flee from B., which was, however, retaken by General Whitelock, 19th April 1858. Pop. (1872) 31,044. The *executive district* of B., which is level, and fertile in cotton, wheat, and barley, has an area of 1960 sq. miles, and a pop. (1872) of 934,348.

Buddh'ism (from the title of 'the Buddha,' the enlightened, assumed by its founder), a system of religion founded about 2500 years ago in India, and which, though it has now disappeared from the land of its birth, is professed by 455,000,000 of people, being more than 31 per cent. of the human race, in Cashmere, Nepaul, Thibet, Tartary, Mongolia, Japan, Siam, Burmah, and Ceylon. The reputed founder of the system figures in the legend of his life as the son of Sudhodana, king of Kapilawastu, a region in Central India at the foot of the mountains of Nepaul; and at his birth (the date usually assigned to which is 543 B.C., though later research places it sixty years after) is said to have received the name of Sidhartha. His father, we are told, belonged to the family of the Sakyas; hence, in allusion to the mode of life he adopted, he is sometimes called Sakya-mouni (Sansk. *muni*, 'a solitary'); and as the family belonged to 'a chain of the Gautamas, he is also called Gautama-Buddha. But the legends of his life, ancestry, and youthful career are not satisfactory even as legends, and the tendency of all later criticism (see M. Senart's *Études Bouddiques*, Par. 1875) is to destroy their value as historical documents. Many of the circumstances belonging to this period of his life are probably not legendary in the true sense at all, but parables or allegories, containing slight vestiges of real history. After B. left his father's palace, he became the pupil first of one Brahmin teacher, then of another; from them he learned to subdue the body and to discipline his mind by constant and well-directed meditation. During six years, spent partly in practices of great austerity, he failed to obtain the deliverance sought. After long meditation and ecstatic visions, however, he at last, by sheer force of thinking, arrived at the knowledge of the truth. He discovered the causes of all the changes inherent in human life, by which means the fear of them was entirely removed. He now desired to make known to mankind the valuable secret which he himself had learned, and having assumed the title of 'the Buddha' (the enlightened), he set out for Benares, the sacred city of the Brahmins, where he preached with great success. After travelling over the most of India, making many converts wherever he went, he died at the age of eighty, while sitting under a tree near Kusinagara.

The most striking feature in the history of B. is its power of proselytising, a power arising from the universal sympathy and brotherhood which it inculcated. By the middle of the 3d c. B.C.—i.e., in the time of Asoka—it was the established religion of the country. Missionaries were sent to other countries, who went upon a regular system of preaching, teaching, and disseminating the sacred doctrines. The first country converted was Ceylon. If we can still trust the *Mahawanso* (though its authority is now being seriously questioned), this conversion took place soon after Asoka's time. Ceylon has adhered to the Buddhist religion as a country down to the present day. From Ceylon it spread to Siam and Burmah. It reached China (according to the best authorities) about the 1st c. B.C., and before the close of the 1st c. A.D. was declared one of the state religions. Streams of pilgrims now flowed from China to India, which was regarded as

the Holy Land, while the religion spread largely into Central Asia. But in the early centuries of our era there was a revival of Brahminism in India, before which B. was forced to give way in that country. By the end of the 4th c. it was beginning to decline in the eastern part, although in the 7th c. it was still flourishing throughout the country. But from this time its decline must have been very rapid (though the 7th c. marks its triumph in Tibet), for in the 12th c. the last trace of it almost had disappeared from the country.

The Buddhist Holy Scriptures, containing the tenets of the system, the canon of which was said to have occupied the attention of a council held after the death of Buddha, and to have been fixed by a council in Asoka's time, and confirmed by a council in Cashmere in the beginning of our era, are called the Tripitika (three baskets), and are divided into three classes:—(1) The Sūtras, or discourses of the Buddha, not written down by himself, but by his chief followers immediately after his death; (2) The Vinaya, comprising all that has reference to morality or discipline; (3) Abhidharma, or metaphysics.

B. can only be called a religion at all in a very peculiar sense, since it is theoretically a pure atheism. It ignores the existence of a deity. Nevertheless the moral code of the system is one of the purest in the world. The basis of its ethics, which are so inextricably mixed up with the metaphysics that the two cannot be considered separately, is what the Buddha called the Four Verities:—(1) That pain exists, (2) that the cause of pain is attachment to existing objects, (3) that pain can be ended by Nirwana ('extinction,' but of what is still matter of dispute), (4) the way that leads to Nirwana. The way to Nirwana consists of eight parts:—(1) Right faith (orthodoxy), (2) right judgment, (3) right language (truthfulness), (4) right purpose (uprightness), (5) right practice (the pursuit of a religious life), (6) right obedience (to all the precepts of the Buddhist law), (7) right memory, (8) right meditation. The supreme controlling power of the universe is Karma, that is, a chain of linked processes, which continually and necessarily recur in uniform regularity of sequence, by which all things are determined. The Buddhist believes that he has existed in many myriads of previous births (see TRANSMIGRATION), and may have passed through all possible states of beings, from the highest to the lowest (of men, and also of animals, and even of inanimate objects), and that he is in this life under the influence of all that he has ever done in all these previous existences. This is his Karma, the arbiter of his fate. Further, no one can tell in what state his next birth may be appointed by his Karma, for although he might live till the day of his death the most meritorious of men, and although there will certainly be a reward for all that is good, that reward may be long delayed, and there may be in his Karma some sin or crime committed ages ago but not yet expiated, and he may have to pay the penalty in the next life by being born as some degraded creature, or, if that be not enough, in one of the 136 Buddhist hells.

The two important points in this system are, that existence is an evil, and that the continuance of existence is unavoidable except by the attainment of Nirwana. Now it is teaching to mankind how this may be attained which is the prerogative and the special mission of a Buddha—a Buddha being not a deity in any sense of the term, but simply a human being of an exalted nature—which may be attained by any other human being by the practice of certain virtues. And a great part of the veneration paid to Gautama-Buddha is due to the supposition that, when he had it in his power to attain to Nirwana himself, he voluntarily endured indescribable afflictions in countless ages and successive births that he might attain to the Buddhahood, and thereby gain the power to free mankind from the misery of existence. This, then, is the basis on which all Buddhist morality is founded: what the Buddha taught mankind was how they might gain 'the other shore'; that other shore is Nirwana; so that, in other words, all virtue is to be practised, not for its own sake, but merely as a means to enable the person to escape from existence. At the same time it must not be overlooked that Nirwana is to a great extent the abstraction of a theological metaphysic; the hope of the masses is the bliss of heaven, which is believed to be the reward of virtue.

The eight parts of the way to Nirwana given above were developed into a set of practical moral and religious precepts. These depend on the different classes of sins. There are three sins of the body—murder, theft, adultery. Four of the speech—lying, slander, abuse, unprofitable conversation. Three of the

mind—covetousness, malice, scepticism. Five other evils to be avoided—drunkenness, gambling, idleness, improper associations, the frequenting of places of amusements. In connection with these there are five great commandments binding on all—not to kill, not to steal, not to lie, not to get drunk; next comes not to commit adultery. Five others for those entering on the direct pursuit of Nirwana—to abstain from unseasonable meals, from public spectacles (music, dancing, singing), from expensive dresses, ornaments, and perfumes, from having a large or soft bed, and from receiving gold or silver. For the regular recluses, ascetics, or monks, a number of observances of the severest character are prescribed—to wear only clothes made of rags sewed together with their own hands, to live only on alms, to take only one meal daily, and that before noon, to live in forests or deserts, approaching human dwellings only to get alms, to seek no shelter but trees, to rest only sitting at the root of a tree, and even sleep there without lying down, to meditate at night among the tombs on the vanity of all things.

The worship connected with the religion consists of adoration of the statues of the Buddha and of his relics, chief of which are his teeth. In theory, however, it may be distinguished in the popular mind from simple worship; the ritual is strictly commemorative; the worshipper's desire is to set before himself the 'example of him who trod the path that leads to deliverance.'

The great authority on B. is still Burnouf, *Introduction à l'Histoire du Bouddhisme* (Par. 1845). See also Wassilieff's *Buddhism, its Doctrine, History, and Literature*, and Professor Keri's *Dissertation on the Era of B. and the Asoka Inscriptions* (Amst. 1873). For a popular account, the reader may consult Eitel's *Lectures on B.*; Beal's *Catena of Buddhist Scriptures, from the Chinese* (1871); Spence Hardy's *Manual of B.*; *Legends and Theories of the Buddhists*; St. Hilaire's *Le Bouddha* (3d ed. 1862), and T. W. Rhys David's *Buddhism* (Lond. 1877). Childers, Max Müller, Lassen, Koeppen, &c., have written works on *Nirvana*, &c. MM. Senant, Feer, and Barth are the most recent and the best guides for a critical treatment of the legends of B.

Budd'ing, a mode of grafting in which a leaf-bud is used as a graft instead of a young shoot. See GRAFTING.

Budding, or **Gomma'tion**, in zoology, a name applied to the asexual process of reproduction, whereby new animals are produced by a process analogous to that of B. in plants. B. in animals may be *continuous* or *discontinuous*. In the former case (seen in *Hydrosca* or zoophytes, sea-mats, or *Polyzoa*, &c.), a complicated and connected animal colony, made up of numerous separate animals or zooids, is produced. In the latter case, buds are detached, and form the beginnings of new colonies, or live a separate and single existence. B. occurs in *Protozoa*, *Calenterata*, *Echinozoa*, in a few *Annulosa*, and in lower *Mollusca*.

Buddleia, a large genus of shrubs of the natural order *Scrophulariaceae*, containing about eighty species, two of which (*B. Neemda*, a beautiful plant, a native of India, and *B. globosa*, of Chili) are cultivated in our gardens.

Bude Burner and **Bude Light**. See BURNERS.

Bud'get (Fr. *bougette*, Ital. *bolgetta*), the name of a small sack or wallet, with its contents, and hence applied metaphorically to a miscellaneous store of things, as a B. of news. In its familiar sense it means the annual financial statement made by the Chancellor of Exchequer to the House of Commons in a committee of ways and means, embracing a general view of the public revenue and expenditure, an estimate of the probable expenditure of the ensuing year, and a declaration of what taxes it is intended to reduce or repeal, or what new ones it is found necessary to impose.

Budhan'uh, a town in the district of Mozuffernuggur, N.W. Province, British India, 20 miles N. of Delhi, in a fertile and woody country. Pop. (1872) 6750.

Budös or **Budösch Hegy**, a steep isolated mountain of the Carpathians, in the S.E. of Transylvania, situated on the boundary-line between the districts Csik and Haromszek, and rising to a height of 3005 feet. It is of volcanic origin, and has many sulphur-springs and caves containing sulphurous vapours.

Bud'weis (Bohem. *Budejovice*, 'the place of huts'), the capital of a circle of the same name in the extreme S. of Bohemia,

on the Muldau, 77 miles S. of Prague, and a station where the railway to Linz and Vienna diverges. It is partly fortified, contains a cathedral, and has an active transit trade. There are also manufactures of woollens, machinery, stoneware, chemicals, and lead-pencils. Near B. is the fine old *Schloss Frauenberg* (*Hluboká*), and also a spacious new Gothic castle, both the property of Prince Schwarzenberg. Pop. (1869) 17,413. The *district* of B. has an area of 1754 sq. miles, and a pop. (1869) of 240,790.

Buen Ayre, or Bonaire, one of the Curaçao Islands, in the Caribbean Sea, lat. 12° 20' N. and long. 68° 27' W. It is 20 miles long by 4 broad, has 3300 inhabitants, and exports cochineal. The group belongs to the Dutch.

Buenos Ayres (Span. 'fine airs'), the capital of a province of the same name, seat of the Argentine government, and the great centre of trade for the whole republic. It lies on the right bank of the Plata estuary, 150 miles from the sea, is built in great part of wood, having granite-paved and regularly arranged streets. The chief public buildings are the cathedral, a university (founded 1821), a military college, a large market with shops under arched colonnades, the new Government offices, the custom-house, an exchange, several banks, and a fine theatre. A thorough scheme of drainage and of water-supply is being carried out (1875), the contract for which amounts to about £3,000,000. There are numerous tramways throughout the city. Owing to the shallowness of the river, sea-going vessels have to anchor within from 7 to 15 miles W. of B. A., and the cost of transport to the shore is occasionally greater than the freight from Europe. To obviate this, the Government projected (1874) an extensive series of docks, but little has yet been done beyond dredging the channel. The town is situated to command the overland Chili trade, and is the emporium for an immense tract of pastoral country. There are thirteen regular lines of steamers sailing between B. A. and Europe, touching at the ports of Brazil and Monte Video. The exports are chiefly wool, hides, animal oil, horns, hair, cured and salted meat, bones, and ostrich feathers. Of the imports the most important are coal, iron, wood, agricultural implements, and various manufactured goods. In 1872 the import of wines, beer, and spirits amounted in value to £1,850,000, and that of woven fabrics to £2,600,000, while the total value of imports in 1873 was £11,886,861, and of exports £6,886,506. There was also received (1872) 38,000,000 feet of timber, mostly from Canada, and 92,000 tons of coals. B. A. is the terminal centre of four railway lines, and has communication with the various towns of the republic by means (1875) of 4500 miles of telegraph-wire. A submarine cable is being laid (1876) between B. A. and Brazil, to connect the former directly with Europe. Pop. (1869) 177,787, of whom many are English, French, and Italian. A fort was founded here by Pedro de Mendoza in 1535, but was destroyed by the Indians four years later, and not rebuilt until 1580. It thereafter prospered, was made a bishopric in 1620, and became the capital of the Spanish viceroyalty of La Plata in 1776. In 1806, it was twice taken by the English, and as often recovered by the Spaniards. Another effort to take the town in 1807 entirely failed; and General Whitelock, commander of the besieging force, on his return to England was in consequence cashiered for incapacity. B. A. was several times the scene of contest during the Argentine civil wars, which terminated in the peace of 1860. It was visited by a severe yellow-fever epidemic in 1871. The *province* of B. A. is the most productive and populous in the whole republic, and has an area of 63,000 sq. miles, and a pop. (1869) of 495,107, of whom 151,241 are immigrants, some 70 per cent. of the whole being engaged in grazing and agriculture. The country is very flat, and the climate is generally healthy, with a tendency to sultriness. Some 400 miles of railway (1876) traverse the province, radiating from the capital in four different lines. A few industries, as the preserving of meat, and the manufacture of cloth, soap, and leather, have been introduced of late years. See Wilcocks, *History of B.* (Lond. 1806); Balcarce, *B. A.* (Par. 1857).

Buffalo, a city and port of entry in the state of New York, at the mouth of B. Creek, on Lake Erie, near the head of Niagara river. It is 22 miles S.S.E. of Niagara Falls, and 293 N.W. of New York. The city extends from some low ground to a high plateau, and the streets are spacious, clean,

and well built. Its most notable buildings, besides several of its seventy churches, are the State Arsenal, the U.S. Custom-house, the City Hall, and four markets. B. is well situated for receiving the trade of the lakes and the great West. It is a great railway centre, and the Erie Canal (364 miles) connects it with the Hudson. The receipts of grain have immensely increased of late years, in consequence of the erection, since 1842, of some thirty immense storing warehouses, called *elevators*. Total imports and exports, about 100,000,000 dols. B. has extensive spirit distilleries, oil-refineries, and flour-mills, while its smelting furnaces and numerous engine and nail works are among the largest in the States. Its harbour is accessible to vessels drawing 14 feet of water, and there is now a pier 1500 feet long, which supports a lighthouse. The accumulation of ice at the end of the lake impedes navigation during winter. B. publishes some twenty-eight newspapers. It was founded as a military frontier station in 1801, and was destroyed by a party of British and Indians in 1814. It was rebuilt in 1814, incorporated as a city in 1832, and has now (1875) a pop. of 134,238.

Buffalo (*Bos* or *Bubalus bubalis*), a genus of *Bovide* or oxen, represented typically by the common B., which exceeds the common ox in size. Its original habitat appears to have been India, but it has extended its distribution, being now found in Persia, Arabia, Egypt, S. Africa, Greece, Italy, and other parts of S. Europe. It is employed in India, Italy, and elsewhere as a beast of burden.

The forehead is convex, and bears two horns, which are of black colour, and turned outwards and slightly backwards, and have a prominent ridge in front. The hair is coarse and scanty, except on the cheeks and throat, and a 'dewlap' exists. The tail is tufted. The back is elevated between the shoulders, so as to give the animal a somewhat 'humped' aspect. These creatures are gregarious in habits, and live chiefly in marshy districts. They never appear to attain a great degree of domestication. The flesh is coarse, the milk, however, being esteemed. The *Ghee*, a butter-like compound in repute among the natives of India, is made from B.'s milk. The Cape B. (*Bos* or *Bubalus Caffer*), another species, inhabits S. E. Africa, and extends as far N. as Guinea. It exists in numerous herds. The horns are very large, their flattened bases forming a bony plate covering the top of the head. The coat is of a brown colour, the horns being coloured black. In length, this species averages eight feet, and in height at the shoulders about five feet. These animals are very ferocious, especially when irritated or pursued. They are hunted for the sake of their flesh and hides; the latter being manufactured into shields by the Caffres, and into other articles. The American B. or bison (*Bison Americanus*) is described in the article BISON. The huge Arnee of India (q. v.) is presumed to be a variety of the B.

Buffalo-ra, a small town in the province of Pavia, N. Italy, on the Ticino, 25 miles N.N.W. of Pavia, historically interesting as the scene (June 4, 1859) of a fierce conflict between the French under Macmahon and the Austrians, in which the former were victorious. Pop. 1257.

Buffet is a French term applied to any article of furniture which serves the purpose of a cupboard or sideboard. It has given rise to a curious corruption in English. See BEEF-EATER.

Buff Leather is prepared from ox-hides by the process of oiling, without the use of any tanning material. It forms a soft, pliant material with a porous texture, but it is at the same time strong and durable. The hides to be prepared as B. L. are limed, unhaird, and scraped, as in the ordinary tanning process, after which it is handed over to the currier, who works a quantity of cod-oil into it in the trough of a fulling-mill. After the oil has been absorbed, and the skins operated on have a dry-like appearance, they are again sprinkled with oil and the stocking repeated, which process goes on for several days, decreasing however in frequency of oilings. The skins, after the oiling is

Buffalo.

complete, are hung in a drying chamber heated by steam-pipes, in which they undergo a slight fermentation, which induces a more thorough incorporation of the oil. The excess of oil is removed by treating with a weak potash-lye, washing out, drying, stretching, and smoothing with pumice. The buff colour is given by dipping in an infusion of oak-bark. B. L. is largely used for military belts, house shoes, and other purposes.

Buffon, George Louis Leclerc, Comte de, a famous French naturalist and physicist of the 18th c., was born September 7, 1707, at Montbard, in Burgundy. He studied law at the college of the Jesuit fathers in Dijon, but soon turned his attention to science. Amongst his earliest literary productions are translations of Newton's *Fluxions* and of Hales's *Vegetable Statics*. It is as a naturalist that B. is chiefly celebrated, although his studies also included observations on the inorganic portion of natural objects. He contributed to the French Academy of Sciences in 1733 original memoirs on zoological subjects, and was appointed in 1739 curator or keeper of the Royal Garden and Museum. He worked successfully to establish systems of arrangement and classification in zoological science; and his large book, *Histoire Naturelle* (15 vols. Par. 1749-67) constitutes a memorable epoch in natural history literature, as being among the first attempts on a large scale to remodel the insufficient and inaccurate systems of zoology that had hitherto prevailed. B. was created Comte de B. by Louis XV., whose favour, with that of Louis XVI., he enjoyed. He died in Paris, April 16, 1788. B.'s literary style is marred by certain grandiose mannerisms. As an observer he was acute and quick to discern, but lacked patience and perseverance. His works have been translated into almost all the languages of Europe. The two best editions are those of Richard (Par. 1824 *et seq.*) and Farné (Par. 1837-39). See Flouren's *Buffon, Histoire de sa Vie et de ses Ouvrages*; and two fine works 'crowned' by the French Academy—Michaut's *Éloge de B.* (Par. 1878), and Hémon's *Éloge de B.* (Par. 1878), both of which writers availed themselves of the invaluable material contained in the two volumes of B.'s *Correspondance*, first published in 1860 under the editorship of M. Nadauld de B., a great-grandnephew of the illustrious naturalist.

Buffoon (Fr. *bouffon*, Ital. *buffone*), a common jester or mountebank, probably so called on account of his horseplay and vulgar pleasantries; the most likely origin of the name being the *buffa* of the middle age Latin, from *buffare*, 'to puff the cheeks.' The Italian *buffo* is the name given to a humorous actor, and a burlesque play is called a *commedia buffa*, and a comic opera an *opera buffa* (Fr. *opera bouffe*). In Italian opera there is a *buffo cantante*, with a good voice—usually bass, who is distinct from the *buffo comico*, or regular scaramouch.

Bug, the Western, is the largest tributary of the Vistula, rises in Galicia, forms a part of the W. boundary of Russia, and joins the Vistula 18 miles N.W. of Warsaw, after a course of 450 miles. The Eastern B., the ancient *Hypanis*, rises near the confines of Volhynia, and joins the Dnieper 25 miles below Nicolaiev. Both are in part navigable.

Bug, a name popularly applied to insects belonging to the order *Hemiptera*, including the *Geocorida* or Land Bugs (e.g., bed-B., &c.), and the *Hydrocoris* or Water Bugs (e.g., Boat-fly, q. v., &c.). These insects are more properly included in the *Heteropterous* group of the order *Hemiptera*, or those possessing the front wings horny in part, with the *rostrum* or *beak* springing from the front of the head. The mouth in all is specially adapted for piercing the skin of animals or plants, and contains pointed bristle-like organs representing the jaws. The house or bed-B. (*Cimex lectularius*) is wingless, possesses a flat, oval body, and averages $\frac{1}{2}$ to $\frac{3}{4}$ of an inch in length. The colour is reddish, and the mouth is suctorial in form. These insects exhale a disagreeable odour, especially when touched or crushed. The young of the B. resemble the parent save in size, and are active throughout their metamorphosis or development, which is of the incomplete or *hemimetabolic* kind. The B. was believed to have been first brought to England in American timber after the Great Fire of London in 1666; but this idea is erroneous. These insects infest furniture and the crevices of walls by day, but are active during the night, and then suck the blood of man or other animals. The best *preventive* is thorough cleanliness, whilst corrosive sublimate solution, turpentine, and other remedies, are said to be destructive to these insects.

Other species of bugs infest the lower vertebrate animals, and some inhabit and suck plant-juices. Several tropical species attain a large size, and are proportionately annoying in their blood-sucking habits. The field-bugs of Britain also form typical examples of these insects; a well-known species of the latter forms being *Acanthosoma grisea*, which is noted for its attention to its young.

Bugeaud, de la Piconnerie, Thomas Robert, Marshal of France, was born at Limoges, in France, October 15, 1784. Although he entered the army in 1804 as a private, he rose rapidly, and was a colonel before the fall of Napoleon. After the revolution of 1830, B., having turned Liberal, became a favourite of Louis Philippe, but was unpopular with the Paris populace from his declaring against universal suffrage and the freedom of the press. Appointed Governor-General of Algeria, he gained, August 14, 1844, a great victory over the Emperor of Morocco at Isly, and was created Duc d'Isly; but the cruelty of some of his proceedings made his name detested throughout Europe. B. stuck to the last by Louis Philippe, but under the Presidency of Louis Napoleon was made general of the army of the Alps. He died of cholera at Paris, June 9, 1849.

Bu'genhagen, Johann (*Pomeranus*), a German Protestant theologian, born at Wollin, Pomerania, 24th June 1485, and studied at Griefswald. In 1503 he became rector of the school of Treptow, but was led by the perusal of Luther's *De Captivitate Babylonica* to repair to Wittenberg, and take an active part in the Reformation. There he was appointed Professor of Theology in 1522, and then pastor of the town church. B. proved an admirable organiser of the new churches, and for this purpose was called in 1537 to Denmark by Christiern III. He performed his task so satisfactorily that the king offered him the rich bishopric of Schleswig, which B. refused. He died 20th April 1558. B. assisted Luther in his translation of the Bible, and wrote several treatises, among which are *Historia Christi* and *Explicatio Psalmorum*, published at Frankfurt in 1614, which evince great exegetical ability. He also turned Luther's High-Dutch Bible into Low Dutch (Lüb. 1533) for the use of the Lower Saxons. See Engelken, *Joh. B., Pommer.* (Berl. 1817); and Zietz, *Joh. B.* (Leips. 1829; 2d ed. 1834).

Bugle, a wind instrument, similar in principle to the trumpet, cornet, &c. Its special peculiarity is that the tube increases in diameter very gradually through a great part of its length, while in the trumpet the tube is nearly parallel throughout, swelling suddenly at the bell. The form of the tube modifies the quality (or *klang*) of the notes produced, making them (in this case) more mellow and round, and less brilliant and piercing than in the trumpet.

Bugle (*Ajuga*), a genus of the natural order *Labiata*, spread over Europe, Asia, Africa, and Australia, but unknown in America. There are many species, of which three—*A. reptans* (the creeping B.), *A. Chamæpitys*, and *A. Genevensis* (*pyramidalis*)—are found in Britain. *A. Alpina* is found in the Alps. Most of the species of *Ajuga* have beautiful flowers.

Bugloss (*Lycopsis*), a genus of the natural order *Boraginaceæ*, though the name is also popularly applied to *Anchusa* or alkanet, &c. Only one small *L. arvensis* is found in Britain, but the name of *Viper's B.* is given to the genus *Echium*.

Buhl, or **Boule-Work**, surface ornament consisting of tortoiseshell inlaid with brass and white metals, employed in adorning furniture, and introduced into France during the reign of Louis XIV. by André Charles Boule. This costly style of decoration is yet occasionally adopted in workboxes and small toilette articles.

Buh'reach, or **Bharaich**, the capital of an executive district in the province of Oude, British India, on the Sarju, 65 miles N.E. of Lucknow. It has considerable trade in rice, sugar, cotton, indigo, and tobacco. In its vicinity is the tomb of the Moslem saint Selar. Pop. (1869) 18,889. The district of B. has an area of 2710 square miles; pop. (1872) 774,640.

Buhr'stone, or **Burrstone**, a hard, granular, siliceous sandstone, used for making millstones for grinding meal and flour, and for powdering cements, manures, &c. They are composed of almost pure silica, with only sufficient lime to bind

them together, and they form very durable grinding surfaces. The buhrstones mostly used in this country come from the Tertiary deposits of the Paris basin (Seine et Marne), and are of a porous texture, with a light-yellow colour. They obtain their name from the 'burr' or grooved surface, which has either to be picked or cut with diamond into them to give sharp grinding edges. For making millstones, blocks of B. have to be carefully jointed together, and backed with a thick coating of concrete. Buhrstones are also imported from S. America.

Building. The erection of a house, or other such structure, requires generally the co-operation of several professions. The design of the whole work is prepared by an architect, who also makes out detail drawings and a complete specification. The actual execution of the work is undertaken by a builder, who is paid either a fixed sum on account of the whole contract, or from a schedule of prices agreed on at the commencement for each particular kind of work. A 'clerk of the works' is appointed to superintend their construction in the interest of the owner and architect. The architect himself is commonly paid by a commission on the value of the work. In the large structures, in which much iron is employed (railway stations for example), now so frequently erected, the civil engineer has to a great extent taken the place of the architect, and the builder has been superseded by the contractor. The result is not always quite satisfactory from an æsthetic point of view; but, regarded as pieces of engineering, nothing could be much finer than some of the immense iron roofs for stations erected within the last few years. In parts of London (and elsewhere) a practice has grown up among builders of erecting houses 'on speculation'—becoming their own architects and clerks of works. The result has been disastrous as regards the public, the houses being too frequently carelessly put up, badly drained, and altogether inferior.

Building Act, Metropolis. See METROPOLIS LOCAL MANAGEMENT ACT.

Building Company. Of recent years an immense number of companies have been constituted, chiefly under the Companies' Act of 1862 and the Amendment Act of 1867, with the professed object of facilitating the building and purchase of houses by the public. These companies have to building societies a relationship analogous to that which a Mutual Assurance Life Society has to a Life Assurance Company. In the societies, profit or loss on the business is divided among the members. In the companies it is divided among shareholders. The B. C. takes money on deposit, for which it pays a somewhat higher rate than can generally be had on money available at call. The depositors have the security of the subscribed capital of the company, and of the real property on which their funds are lent. Loans are repaid by instalments, the rate of interest paid being, while money is at an ordinary value, about $\frac{5}{2}$ per cent. In the difference between the rate charged to borrowers and the rate paid to depositors lies the profit to the company. Borrowers have, of course, to pay the legal expense of getting their loan, and the company has, of course, to pay its expense of management.

These companies undoubtedly have useful functions; but it is to be kept in view that to some extent they give an artificial stimulus to building houses. Money taken on deposit at 3 or 4 per cent—which is a tempting rate to depositors—must be employed so as at least not to cause loss to the company; and if public requirement for house accommodation does not keep pace with the amount of capital thus necessarily employed in housebuilding, the result must be at least a diminution in the numbers and profits of building companies.

Building (Benefit) Societies. These are benefit societies established for the purpose of raising funds to enable the members to build or purchase dwelling-houses, or other real or leasehold estate by means of loans, each member being entitled to a loan to the value of his share. The debt is secured by mortgage to the society, until the whole of it with interest, and fines and other dues, has been paid off. Formerly, under the Act of Parliament, shares were not allowed to exceed £150 each, the corresponding monthly subscription for which was not to be more than twenty shillings. But under the Act of 1874, which came into operation on 2d November of that year, this restriction was done away with, the contribution and ultimate value of a member's share being now at his own discretion. There are two

classes of B. (B.) S.—the terminating and the permanent. By the Act of 1874, a terminating society is declared to be one which, by its rules, is to end at a fixed date. A permanent society is declared to be one which has by its rules no fixed date for ending. A society receiving a certificate under the Act from the registrar is a body corporate. It is empowered to receive money at interest from members or others, but the deposits are not to exceed two-thirds of the amount for which the society holds security from its members. If any society constituted under the Act receives loans on deposit in excess of the prescribed limit, the directors or committee of management are liable for the excess. The society may invest funds not immediately required in real securities and in the public funds. Judicial winding up may be voluntary, or on a petition of three-fourths of the members present at a general meeting. See BENEFIT or FRIENDLY SOCIETIES.

Building Leases. In English law, these are *demises* of land for long periods—usually ninety-nine years or more—for the erection of houses or other tenements. They are granted under authority of the Court of Chancery. In Scotland, the term is limited to a lease for building purposes of land entailed. By 13 and 14 Vict., c. 48, special provisions are made in favour of the building of schools and churches, with playground and burying-ground attached, on entailed estates.

Building Stones. Many varieties of stone, of both igneous and sedimentary origin, are used in construction, but those most universally employed and generally suitable are the sandstones or freestones, limestones, and marbles. A good building stone resists disintegration or peeling on exposure to the weather; it should be easily worked, uniform in texture and colour, and free from joints or cracks. Sandstones or freestones suitable for building purposes occur in most of the older geological formations, beginning with the old red sandstone, which in Scotland, besides furnishing the celebrated Caithness and Forfarshire flagstones, yields excellent common B. S. of various colours, the prevailing tint, however, being red. The building sandstones of finest texture and colour are yielded by the strata of the carboniferous formation, out of which the towns of Edinburgh and Glasgow are chiefly built. The stone of Craigleith quarry, in the vicinity of Edinburgh, stood second on the list of the commissioners who inquired into the question of stones suitable for the new Houses of Parliament. Limestones are not nearly so largely used as a building material, but the magnesian limestone of the Anston quarries in Yorkshire was the stone selected for the Houses of Parliament—an unfortunate selection, for although it has an excellent colour, and is practically imperishable in a pure atmosphere, it weathers rapidly in the air of London. The Bath oolite is very largely quarried in Somersetshire and Wiltshire, and is a fine, compact, pure-coloured building stone. The oolite limestone of Caen is a beautiful material, and much prized for ornamental structures. Many marbles capable of receiving a good polish are found in Ireland, Derbyshire, Devonshire, &c., and used for constructive purposes. The Purbeck marble was formerly in great repute for internal work. Granite is only used as a building material in localities where it is abundant and less hard stones scarce. The town of Aberdeen is built of it, and in a polished state it is very frequently employed in decorative structures. Granite is also very extensively employed in the construction of harbours and seawalls, and as paving blocks. The basalts, porphyries, and greenstones are little used in house-building, but they are employed in pavements, and some porphyries polish into very beautiful ornamental stones.

Bujalan'ce, a walled city in the province of Cordova, Spain, 25 miles E. of Cordova, has manufactures of glass and pottery, and exports agricultural produce. Pop. 9000.

Bukkur, a town in the province of Punjab, British India, 190 miles W. of Lahore. It lies in a fertile district near the E. bank of the Indus, and has some trade and a pop. of 5000. There is also a fortress of this name in Scinde, on an island in the Indus, between Roree on the left bank and Sukkur on the right.

Bukowina, an Austrian crown-land, lies S.E. of Galicia, and has an area of 4035 sq. miles, and a pop. (1869) of 513,404, of whom 56,000 are Roman Catholics, 11,400 Protestants, and 48,000 Jews. It lies among the Carpathians, and is mostly

highland, rising from E. to W. in a series of terraces. The chief river is the Pruth, both banks of which are well cultivated, yielding especially heavy crops of maize. There is much mining of rock-salt (at Kaczika), iron, and copper. The chief town is Czernowitz, and the principal industries are mining and wood-cutting. Formerly a part of Transylvania, it was conquered (1482) by Stephan V., Prince of Moldau, and came under Turkish rule in 1529. It next became a subdivision of Austrian Galicia. In the Russo-Turkish war of 1769, B. was occupied by the Russians; in 1775 it was ceded to Austria; in 1786 it was united to Galicia, and in 1849 erected into an independent crown-land.

Bulak, a town of Egypt, on the right bank of the Nile, in the neighbourhood of Cairo, of which it is the port. It is connected by railways with Suez and Alexandria, and has a custom-house, a bazaar, a central college of dervishes, a medical school, a military hospital, an engineering college, and some silk and cotton manufactures. It has also a Government printing-house, the first ever introduced into the East by a native ruler. This was founded by Mehemet Ali in 1829-30, and still flourishes, the Khedive taking a deep interest in its prosperity. Books are issued from it in Arabic, Turkish, Persian, French, and English. There are at present (1875) 300 persons employed in it and in the paper-mills adjoining, which supply paper for the press. Pop. of B. about 20,000.

Bulb. This is usually described as 'a permanently abbreviated stem, mostly shorter than broad, and clothed with scales which are imperfect thickened leaves, or more commonly the thickened and persistent basis of leaves.' New buds are formed in the axils of the scales, which develop at the expense of the parent B., and finally destroy it.

Small bulbs, or *bulbets*, are produced in the axils of the leaves of the *Lilium bulbiferum* and other plants, which fall off, take root and develop into plants exactly the counterpart of that which produced them, showing their identity and also that of bulbs with buds, though these are usually described as underground stems. Many bulbs are used as food (e.g., those of the onion, garlic, shallot, scallion, chive, the *Camassia* (q. v.) of N.W. America, while others are cultivated for the sake of the beautiful flowers which the plants produce.

Bul'bul, the American name for the Nightingale (q. v.), but also applied to the Insectorial birds scientifically known as the *Pycnonotus hamorrhous* and *P. jocosus*, belonging to the *Dentirostral* section of the order. These birds occur in the E. Indies, and are readily domesticated. The bill is short and compressed, the ridge of the upper mandible being curved. The gape or mouth is provided with bristles. The nostrils are placed in a groove. The food consists of food and insects.

Bulgaria, formerly a vilayet of Turkey in Europe, now an autonomous state tributary to the Sultan, bounded N. by the Danube, E. by the Black Sea, S. by the Balkan range and W. by Servia. Area, upwards of 33,000 sq. miles; pop. (1864) 1,995,243, the majority of whom are Slavs. It is flat and fertile in the N., comprising the southern half of the great plain of the Danube. The district at the mouth of the Danube known as the *Dobrukscha*, hitherto forming part of B., is (since July 1878) annexed to Rumania. The Balkan Mountains attain on the southern frontier an elevation of 6000 feet. They are traversed by several defiles, some of which, such as the Shipka Pass, have been made historically memorable by the recent Russo-Turkish war. From the Balkans the country slopes more or less abruptly to the banks of the Danube, and a smaller plain slopes E. to the Black Sea. Corn, flax, hemp, and tobacco are grown; a considerable quantity of wine is produced, and roses are extensively cultivated for the manufacture of perfume. Timber cut in the defiles is floated down the rivers of B. to the Danube, and large herds of cattle are reared, as are also horses, sheep, and goats, and swine. The manufactures, which are coarse and for home consumption, are trifling, and the imports consist of manufactured goods, spices, coffee, sugar, &c. The capital is Rustchuk (q. v.), and the principal seaport is Varna (q. v.). The Bulgarians, a race of Ugrian Tartars from the banks of the Volga, repeatedly crossed the Danube after the 4th c., and made destructive raids on the Byzantine Empire; but it was not till 680 that they finally subdued the old Moesian population, and established a powerful

kingdom in the present B. They soon, however, became so blended with the conquered Slavs that nothing distinctive remained but the name of the victorious race. In the 9th c. they even adopted the Slavic language. After a long struggle the Bulgarians were themselves forced to acknowledge the authority of the Byzantine emperors in 1018. In 1391 the country was conquered by the Turks. The Bulgarians suffered much from the harsh rule of their masters, and more than once broke out into partial revolt without success. In 1876 an insurrection, probably fomented by Russian intrigues, but certainly provoked by cruel and rapacious oppressions, was quelled by a series of the most horrible outrages ever perpetrated by human beings. The ultimate result was a war between Russia and Turkey (1877), in which the latter power was completely prostrated, and the autonomy of B. secured by the victory of the Russian arms, was definitively declared by the Treaty of Berlin, July 1878. In religion the Bulgarians are Christians of the Greek Church. See Vretos, *La Bulgarie, Ancienne et Moderne* (St. Petersburg. 1852), and Gossip, *Turkey and Russia: Their History, Races, and Wars* (T. C. Jack, Edinb. 1878).

Bul'garin, Thaddeus, a Russian journalist and romance writer, born in Lithuania, 1789. He served for seven years in the army of his native country, and afterwards in that of France till the overthrow of Napoleon in 1814, when he exchanged the sword for the pen, publishing his first efforts in verse at Warsaw in the Polish language. He afterwards settled in St Petersburg, and founded (1825) the *Northern Bee*, the tales and humorous sketches in which soon procured for B. a wide reputation. His best romances are *The Russian Gil Blas* (4 vols. St Petersburg. 1829); *Peter Ivanovitch* and *The False Demetrius* (St Petersburg. 1830), all of which have been translated into French. B. is perhaps still better known by his *Russia in its Historical, Statistical, Geographical, and Literary Aspect* (Ger. transl. Riga, 1839-41), and by his *Memoirs* (6 vols. St Petersburg. 1846-50; Ger. 1858-61). He died at Dorpat, September 13, 1859.

Bulkheads, in a ship, are transverse partitions which serve the double purpose of strengthening the ship transversely, and of affording additional security in the event of leakage occurring through injury to the hull. In order that the latter object may be gained, each bulkhead must be made watertight, and any doors in it must be arranged so that they can be closed watertight. In this way the ship is divided into compartments, and in the event of leakage occurring in any one of them, it can be separated from the others, the buoyancy of which may enable the ship still to float in safety.

Bull (Lat. *bullus*), any object swelling up, and thus becoming round—(1) the capsule of the seal appended to letters from the papal chancery; (2) the seal itself; (3) the instrument or decree itself. Bulls are written on parchment, to which a leaden seal is affixed—by a grey hempen cord if the B. is touching matters of justice, but by a yellow or red silken band when it touches matters of grace. The publication of a B. is termed *bulmination*; the seal bears on the obverse side the arms of the Pope, and on the reverse, his name and the year of his pontificate; and in the interim between the election and consecration of a pope, the seal bears n. arms. Bulls are designated by the first words of their text, as the B. *Unigenitus*; *De Salute Animarum*; *In Causâ Domini*, &c. The Golden B. of the Emperor Karl IV., of which the Latin original is still preserved at Frankfort, was so called from the golden seal appended to it. A collection of papal bulls is a *bullarium*. A diminutive of B. is the Fr. *bulletin* (It. *bul'tino*), applied to the brief despatches of generals; such as the announcements of victories or defeats, to authenticated reports on the health of important public personages, &c.

Wild Bull.

Bull, the name given to the males of the *Bovide* or oxen, which are distinguished from the female animals by their usually larger size and more ferocious disposition. The bulls of some varieties of oxen possess horns, whilst the females are hornless.

Bull. See EXCHANGE.

Bull, George, D.D., a distinguished theologian and prelate, born at Wells, Gloucestershire, 25th March 1634, educated at Twiston and Oxford, and ordained at the age of twenty-one. Having obtained various preferments, and the degree of D.D., he was made Bishop of St Davids in 1705. He died February 17, 1710. He published a number of theological works, of which the most important were *Harmonia Apostolica*, *Defensio Fidei Nicenæ*, against Arians, Socinians, Tritheists, and Sabellians, and *Judicium Ecclesiæ Catholica*, for which he was thanked by Bossuet and various others of the French clergy. As a prelate, B. was distinguished for his candour and toleration.

Bull, Ole Bornemann, a great Norwegian violinist, was born at Bergen, 5th February 1810, and studied for a short time (1828) at the University of Christiania, from which he is said to have been expelled for becoming leader of an orchestra at one of the theatres. In 1829 he went to Cassel to study the violin under Spohr, but was so coldly received that he took to law at Göttingen University. He was subsequently at Minden, from whence, in consequence of a duel, he fled to Paris (1831), where he lived for a time in direst misery. An unsuccessful attempt to drown himself in the Seine is the turning-point in his life. Thereafter he acquired the patronage of a lady of rank, and rapidly rose to fame as a violinist. His playing was original and strange—in the style of Paganini—and his performances were received most enthusiastically throughout Europe and America. In the latter country he retired from public life with a fortune (1869), and married a German lady in Wisconsin in 1870. B. died in 1875.

Bulla, a genus of *Gasteropodous* mollusca, the shells of which, from their light texture, are familiarly known as 'Bubble-shells.' The shell is rounded, and may be partly or wholly external. Its lip is sharp. The animal possesses a large head, which is bilobed posteriorly; the side lobes are of large size, and the hind-lobe covers the spire of the shell. The foot is also large and four-sided. The 'Water-Drop,' or *B. hydatidis*, is a familiar species of the British coasts, and *B. ampulla*, *B. oblonga*, *B. aspersa*, and *B. nebulosa*, are species as noted by various observers. They abound chiefly in the tropic seas. The genus forms the type of the family *Bullada*, which in turn is included in the *Opisthobranchiate* section of the *Gasteropoda* (q. v.). See also MOLLUSCA.

Bullace (*Prunus insititia*), a variety of the common sloe or blackthorn (*P. communis*, q. v.), rare in Scotland, but common in the English hedgerows, banks, and coppices. Its fruit, after having been mellowed by frosts, though acrid, is not unpleasant, and is in some parts of the country a favourite fruit for tarts.

Bullas, a town in the province of Murcia, Spain, 26 miles W.N.W. of Murcia, has manufactures of linen, hemp, and earthenware. Pop. 5145.

Bull-Baiting, a once favourite sport in England with all ranks. The bull was fastened by a rope to a stake and then attacked by bulldogs, one by one, trained to *pin* him—i.e., to seize him by the nose, though they sometimes tried to get under his belly. Much of the excitement of the spectators consisted in observing the success of the bull in receiving his assailants on his horns and tossing them in the air. It was in 1835 put down by Act of Parliament, but not without much opposition, as in some localities it had assumed the form of an annual festival.

Bulldog.

Bulldog (*Canis familiaris*, variety *lanarius*). A breed of dogs distinguished by the massive, strong, and broad fore-quarters, by the short stout neck, and by the thinner hind-quarters. The head in the well-bred B. is round, the skull high, the eye of moderate size, and the forehead depressed between the eyes. The ears should be semi-erect and small, and placed

well on the top of the head; the muzzle short, abrupt, and fleshy; the back short and well arched, whilst the stem should be of moderate length. This breed has been mingled with many others, in order to impart that dogged determination and courage for which the bulldogs are famous; but the breed, of itself, is not now propagated with the same interest as in former years, when 'bull-baiting' was so greatly in vogue. Not naturally fierce or vindictive, these dogs are made so from the treatment to which they are subjected. The breed is believed by some naturalists to represent a cross between the mastiff and hound, or as a mere variety of mastiff. The general colour is reddish, or white and brindled. The *bull-terrier* is a smaller variety of this breed, probably intermingled with the terrier.

Bull'er.—1. A large river in the province of Nelson, in the middle island of New Zealand. It rises in Lake Howick, in S. lat. 41° 30', and E. long. 172° 40'. It flows first N. then N.W., then S.W., and finally W. during the greater part of its course, falling into the Pacific at the town of Westport (see NELSON), after a course of 100 miles. It is a deep and rapid stream, and is liable to sudden and heavy floods.—2. A district in the same province, forming the basin of the river B. It is very mountainous, and the arable land is confined to the valleys. It is one of the principal gold-fields of New Zealand, and the largest nuggets obtained in the colony have been found in this district. The chief centres of population are Westport, Lyell, and Reefton. At the two last, rich reefs of auriferous quartz are worked. Silver, lead, copper, and iron have also been found in the district. Coal of the best quality abounds, but is only beginning to be worked.

Bullet (Fr. *boulet*, dimin. of *boule*; Lat. *bulla*, any round object, a bubble, &c.), a projectile made of lead, and having a spherical, ovoid, or conical form, fired from small arms. With the introduction of the Brunswick rifle into the British army the B. was altered from a spherical to a conical form, and at the same time increased in weight. The conical B. of the Minié rifle, adopted in 1851, had an improvement, in so far as in its base there was a conical chamber into which was fitted an iron cup, which by the explosive force of the gunpowder was driven forward, expanding the B., and causing it to take the grooves of the rifle. In the modified Minié B. of 1853 the iron cup was replaced by a boxwood plug, and the weight was reduced from 670 to 530 grains; the projectile was 1.095 inch in length, and .56 inch in diameter. A B. the same as the last was at first used in the Enfield rifle, but afterwards to allow for windage the diameter was reduced by $\frac{1}{16}$ of an inch. A later change was effected, on the score of as great efficiency and less expense, in the substitution of a baked clay plug for the boxwood one. The B. of the Snider breechloader is 1.065 inch in length, .573 inch in diameter, and 480 grains in weight, while the projectile for the Martini-Henry rifle has the same weight, but is longer and narrower on account of the smallness of the bore, .45. Perfectly pure lead is employed in making bullets, the action of the compressing machine used in the process being one of the many interesting sights at Woolwich arsenal. Bullets are lubricated with pure beeswax.

Bulletin. See BULL.

Bullet-Tree, or **Bully-Tree**, a species of the genus *Mimosa* (natural order *Sapotacea*, q. v.), a native of Guiana, the heavy, dark-grained wood, and the delicious fruit of which (about the size of a cherry) are valued. By some authors the B.-T. is looked upon as *Achras sapota*, a member of the same order. *Swartzia tomentosa*, a native of Guiana, is also sometimes called the B.-T. and the wood beefwood. The bastard B. is *Bumelia netusa*; the black B., *B. ingens*; and the Jamaica B., *Lucuma mammosa*.

Bullfight, a brutal sport of great antiquity. It was popular among the Greeks and Romans, though the spread of Christianity finally brought it into antagonism with the moral sense of the empire. Bishops denounced and popes forbade it, but it appears to have resistless charms for Spaniards of all classes, and is still witnessed with enthusiasm both in the Old World and the New. From April to November is the season in Madrid for the degrading show, and there is at least one a week. It takes place

in the *Plaza de Toros*, a sort of circus which can accommodate from 10,000 to 12,000 spectators. The first who take part in the sport are the mounted *Picadores*, fantastically arrayed like old Spanish knights, and armed with lances. They await the first charge of the bull, and if it proves cowardly, stab it to death. If it fights, the *Chulos* on foot, in bright-coloured cloaks, and decked with gay ribbons, stick into its neck their barbed darts. When the bull is thus infuriated, the *Matador*, the principal performer, with a naked sword in his right hand, and in his left the *muleta*, a small stick with a piece of scarlet cloth attached to it, at which the bull rushes wildly, steps forward to finish the business. If successful, he kills the bull by running his sword in between the left shoulder and the shoulder-blade of the animal. His triumph is greeted with an applause which is not refused to the bull when it happens to be the victor. The combat—if it can be so termed—lasts generally about twenty minutes, but is often repeated eight or ten times in the course of a day's entertainment.

Bullfinch (*Pyrrhula*), a genus of Insectorial birds belonging to the *Corvirostris*, and distinguished, as a genus, by the large size of the head, the stoutness of the bill, the convex ridge of the upper mandible, the rounded wings, and short tarsi.

Bullfinch.

The common B. (*P. vulgaris*) inhabits Britain, Europe, and Asia. The male possesses the top of the head, wings, and tail of a black colour; the back is grey, the rump white, and the under parts reddish. The tail is short and even. The back of the female is brownish, and the lower parts yellowish-brown. These birds feed chiefly upon seeds, and are very destructive in gardens. They inhabit woody districts. The eggs are four or five in number, and are coloured pale-blue, spotted with purple and brown. The natural song of the B. consists of a few plaintive notes, but these birds may be taught to whistle tunes, and thus become favourite pets, fetching high prices when well trained. The piping bullfinches are mostly trained in Germany. These birds appear to be singularly liable to disease, and to die suddenly. The Pinefinch (q. v.), or Pine Grosbeak (*P.* or *Pinicola enucleator*), is an allied species occurring in Europe, but chiefly in America, and inhabiting the Arctic regions in summer.

Bullfrog (*Rana pipiens*), a species of *Ranidae*, or frogs, so named from the hoarseness or loudness of its croak. These frogs occur in N. America, and are most plentiful in the southern parts of that continent. The B. averages from 8 to 12 inches in length, the body being coloured olive-green spotted with black. It inhabits marshy places, and swims well. These frogs make a loud, croaking noise, particularly in the evening, their voice being audible at a distance of 40 or 50 yards. The food consists of worms, insects, and molluscs; but these animals are also credited with seizing young ducks as they swim, and with swallowing their prey whole.

Bullhead (*Cottus*), a genus of Teleostean fishes, belonging to the section *Acanthopterygii*, and included in the *Triglada* or Gurnard family. The B. (*C. gobio*), or 'Miller's thumb,' as it is popularly called, is a fresh-water fish inhabiting some British rivers, and also occurring in Europe and Asia. The head, as in the family generally, is wide and flattened, the mouth being large and provided with numerous small teeth. The pre-operculum possesses a single spine, and the opercula or gill-covers end in a flattened point. The skin is smooth, and destitute of scales, and is coloured dark-brown

Bullhead.

above, greyish-white on the sides, and white below. The fin rays are marked white and dark-brown, and the fins with dark-brown spots. The eyes are yellow, and the pupils are coloured dark-blue. The average length of this fish is four or five inches. It hides under stones and in crevices, into which it pushes its way by means of its strong flattened head. Other species of the B. genus (*Cottus*) are marine in habits, and three familiar forms inhabiting the sea are the *C. bubalis*, *C. scorpius*, and *C. quadricornis*. The armed B. (*Aspidophorus cataphractus*), or Pogge (q. v.), belongs to a different genus, and is a marine form. The body in the latter is enclosed in ganoid plates, the body being eight-angled, and bearing recurved spines on the snout.

Bullinger, Heinrich, was born at Bremgarten, Switzerland, July 18, 1504. He was a follower of Zwingli, by whom he had been converted to Protestantism, and on the death of Zwingli, 1531, succeeded him as pastor at Zürich, where he died, after a laborious and useful life, September 17, 1575. B. had a leading share in the composition of the second Helvetic Confession, and was also the chief medium of communication between the Reformers in Switzerland and in England. Of his numerous writings, the most important is his *Reformationgeschichte*, edited by Hottinger and Vogel (3 vols. Zür. 1838-46). See Hess, *Leben B.'s* (Zür. 1828), and Pestalozzi, *B.'s Leben und Schriften* (1859).

Bullion means usually uncoined gold or silver. But with regard to the currency of a country, the word is commonly used to denote coined as well as uncoined gold and silver. If we suppose that the quantity of B. in commercial circulation in the world was to become fixed, while commerce continued to expand, then B. would become daily dearer, that is, its value relative to the produce of human industry would gradually become greater. On the other hand, a great increase in the earth's yield, or crop, of gold will lower its value relative to the produce of human industry.

Now the increase in the produce of human industry is continually going on, as is the exchange of that produce by trade; but, on the other hand, the earth's yield of gold outstripping the consumption (in plate, tear and wear, &c.), the quantity of gold in circulation is continually on the increase also. We have thus two counteracting forces. In one sense, the mastery tends to go to the one side; in another sense, it tends to go to the other. Hence a great deal of confusion exists in the public mind as to whether the cost of living grows greater or not. The immense increase in the quantity of B. in circulation in England, and its continued increase, will be apparent to any one who will look at any old accounts or records. Even in a village the days are gone of 'passing rich on forty pounds a year.' There are probably in England a hundred men worth £500 a year for one that there was a century ago. The social power, therefore, of £500 a year, or other given income, is correspondingly diminished. This fact is owing to accumulation of gold in the world. But £500 a year will command much that the purse of Fortunatus could not have commanded a century ago. This is too plain to require illustration, and on the whole we believe that the given income will command more luxury now than then.

At the same time, it is social power, and not the luxury, that men chiefly regard; and this being so, there can be no doubt that the tide of B. is ever running against the fixed income, which to some is a serious fact. It is also important in questions connected with the national expenditure, and payment of the national debt. From the fact that, owing to causes stated, there is a tide always running in favour of the borrower and against the lender, it follows that the weight of a national debt is continually diminishing, even though it remains nominally the same.

In the eight years 1858-65, the total importation of gold into England was £219,166,344, and the total exportation was £195,759,150, showing an excess of importation of £23,407,194. See BALANCE OF TRADE. Consult *Fenn's Compendium of English and Foreign Funds*.

Bull Run, or **Bull's Run**, a stream in Virginia, U.S., on the banks of which the Confederates gained two well-known victories during the civil war, the first under Generals Beauregard and Johnston, July 16-19, 1861, and the second under Generals Lee, Longstreet, and 'Stonewall' Jackson, August 30, 1863.

Bull's Eye, in architecture, a glass lens to concentrate the light of a given centre upon an object; in nautical language, it is a small pulley with a rope spliced round the outer edge, and another sliding through a hole in the centre; in rifle-shooting, it is the mark in the centre of the circle on the target.

Bull- Trout, or **Grey Trout** (*Salmo Eriox*), a species of Teleostean fishes, included in the *Salmonida* or Salmon family, found in the sea, but also inhabiting fresh-water rivers at spawning time, such as the Tweed, in which it is very well-known. This form differs from the salmon (*S. salar*) in possessing a thicker head, neck, and tail; the body being in general of a less elegant shape than in the latter form. In old fishes the tail is rounded, the central fin rays becoming larger than the other rays; whilst in the young forms the tail-fin is nearly square. The scales are smaller than those of the salmon, and the male B.-trouts at the spawning-season are coloured brown or reddish-brown, the females being of a light or silvery-grey colour. As in the salmon, only a few teeth exist in the vomer, or centre of the palate. The flesh of the B.-T. is less delicate than that of the salmon. The Danube salmon (*Salmo Hucho*), or 'Hucho,' sometimes also receives the name of 'B.-T.' The latter may attain a weight of from 30 to 50 or more pounds; the B.-T. averaging about 15 lbs. in weight, but attaining in some cases a much greater size.

Bülow, Friedrich Wilhelm von, one of the heroes of the German war of liberation, was born at the family seat of Falkenberg, in the Altmark, 16th February 1755. In 1769 he joined the army, served under Blücher and L'Estocq in the French wars of 1793-95 and 1806-7, and was made lieutenant-general on the eve of the war of 1813. He stormed Halle (May 2), and rescued Berlin by his victory of Luckau (June 4) over Marshal Oudinot, whom, along with Marshal Ney, he again defeated at Grossbeeren. As a reward, he was made a knight of the newly-instituted order of the Iron Cross. B., by forced marches, arrived first at the gates of Leipzig, and contributed much to the final defeat of the French. In 1814 he drove the French from Holland and Belgium, then took part in the campaign of the Allies, and finally captured Montmartre. For these services the King of Prussia raised him to the rank of general of infantry, and conferred on him an estate worth £20,000, with the title of *Graf von Dennewitz*. His last action was at Waterloo, where he led the column that came first to Wellington's assistance. He died at Königsberg, 25th February 1816. B. was thoroughly skilled in the theory and practice of war, and is said never to have lost a battle himself or to have fought on the losing side. He was devoted to the fine arts, especially to music, and composed several motets and a mass, and set the 51st and 100th Psalms to music. See *General Graf B. von Dennewitz in den Feldzügen 1813 und 1814* (Leips. 1843), and *Varnhagen von Ense's Leben* (Berl. 1854).

Bülow, Hans Guido von, the greatest, with perhaps one exception, of living pianists. He was born at Dresden in 1830, but did not show any aptitude or liking for music until after recovery from a long illness which he had as a child. Although intended for the law, he fortunately received early musical instruction, and as a young man embraced heartily the ideas (political as well as musical) of the Romantic school. His first hearing of Wagner's *Lohengrin* (under Liszt, at Weimar), in 1850, decided him to leave law and take to music as his profession. Since that time he has been one of the foremost in the great movement with which the name of Wagner is more intimately associated. Two of Wagner's operas—*Tristan and Isolde* (in 1865) and *Die Meistersinger* (in 1868)—were brought out under his baton, for he is as great a conductor as performer. B.'s memory is of astonishing power; he plays invariably without music before him, and on one occasion actually conducted *Die Meistersinger*, which occupies over four hours in performance, by heart. His compositions, which are not very numerous, are not known in this country, as he does not play them himself.

Bulrampur, or **Balrampur**, a town in the executive district of Gonda, province of Oude, British India, on the Raptée, 90 miles N.E. of Lucknow. It lies on the great Tibetan route, and has considerable trade. Pop. (1869) 14,026.

Bulrush, a popular name applied to reed-looking plants, such as *Typha* (q. v.), *Scirpus* (q. v.), particularly *S. lacustris*, &c., growing in marshes.

Bulrush of the Nile (*Papyrus antiquorum*), is famous on account of the soft cellular tissue in its stem having been used by the ancients for making paper, remarkable for its durability, and also for making ropes, mats, &c. The Sicilian *P. sicula* has also been used for making paper, and at the present day *P. corymbosus* is used in India for the manufacture of 'Indian matting.'

Bul'sar, or **Balsar**, a thriving seaport in the district of Surat, province of Bombay, British India, situated on the Gulf of Cambay, 44 miles S. of Surat. B. has gingham manufactures, and a considerable trade in grain and sugar. Pop. (1872) 11,765.

Bul'ti, **Baltistan**, or **Little Tibet**, a division in the N.W. of Cashmere, lies between the Himalayas on the S. and the Karakorum Mountains on the N., and is bounded W. by Ladakh or Middle Tibet, and E. by Astor. Area, 18,000 sq. miles; pop. some 500,000, mostly Mohammedans. It is a region of sublime scenery, where alternate beautiful valleys, silent wastes, mighty cataracts, and stupendous mountains rising in rugged precipices. The Upper Indus traverses the country, and in the S.W. are the Plains of Deosai, or the Devil's Plains, with an average height of some 16,000 feet. Skardo is the capital, and along the river there are many small towns and villages. B. was independent till 1840, when it was conquered by Cashmere.

Bulubgurh, or **Furreed'abad**, a walled town in the executive district of Delhi, province of the Punjab, British India, in a fertile country, 18 miles S. of Delhi. It is the residence of a native rajah, with whose authority the British do not interfere, and whose jaghire has an area of 190 sq. miles, and a pop. of 57,000. Pop. (1868) 7990.

Bulwark, in a ship, the continuation of the sides of the vessel above "level of the upper deck, so as to prevent objects from being thrown off the ship as she rolls, and to prevent the waves washing over her too freely under the same circumstances.

Bulwer-Lytton. See **LYTTON, LORD**.

Bul'wer, **Sir Henry Lytton, G.C.B.**, the eldest brother of Lord Lytton, was born in 1804. After serving in various British embassies, he sat in the House of Commons from 1830 to 1837. He then was sent as Secretary of Legation to Constantinople, where he negotiated an important commercial treaty. In 1843 he became Plenipotentiary at Madrid, where he acted firmly in a position made difficult by the dictatorial and reactionary policy of Narvaiz. After being stationed at Washington, he was in 1856 sent by Lord Palmerston (who had great confidence in him) to Bucharest, to investigate the question of the Danubian Principalities, and soon after succeeded Lord Stratford de Redcliffe as ambassador at the Porte. In 1871 he became Lord Dalling and B., and died at Naples, 23d May 1872. B. was successful both as a diplomatist and as a literary man. His *Life of Palmerston* (1870), containing a short autobiography, and his *Historical Characters* (1868), are his latest and best works. He has also written on France and Greece, and a *Life of Byron*.

Bum'boat, a boat allowed to visit ships lying outside a port or harbour, so as to supply the sailors and officers with fresh provisions, articles of clothing, &c. In British ports, B. traders are, as a rule, women.

Bum'kin, or **Boomkin** (Dutch *boom*, a tree or beam; and *kin*, Ger. *chen*, a diminutive), a short boom projecting over each bow of the ship, for the purpose of stretching the foresail farther to windward than the width of the deck at that part permits.

Bummalot'i. See **BOMBAY DUCK**.

Bunch'grass (*Elymus condensatus*), a valuable pasture grass found extensively over the open country to the W. of the Rocky Mountains, and remarkable for the great size to which it grows

Bulrush.

and its fattening properties. Cattle can be driven from the coast to the Rocky Mountains, living on nothing else than this grass, and will arrive fatter than when they started. The droves of cattle and horses which winter in that region live entirely upon it, and will scrape it up under the snow. It is accounted superior to hay. It grows in 'bunches,' hence the name. Dr Robert Brown introduced it into this country in 1866, but it is not yet grown to any extent, though it would be a valuable fodder grass, as well as a protection for game in poor, dry soils. Under cultivation it has attained the height of nearly 10 feet. See Gorrie, in the *Farmer*, March 4, 1868, December 19, 1869, and June 18, 1870.

Bun'delcund, or **Ban'dalkhand**, an agency of British India, in the E. of the great triangular plateau of Central India, is divided into twenty-four small native states, and four jaghirdars. Area, 22,351 sq. miles; pop. 2,394,800. It is traversed by the Puna mountain range, with deep ravines and isolated crags on its N.W. side, and is watered by the Betwah, Son, and Tonse, affluents of the Jumna and Ganges. There is much forest and jungle. In the N. it becomes an amphitheatre of sandstone precipices, forming part of the vast rugged country which stretches N. to the Jumna. B. is intersected in the E. by the East Indian Railway. The various states, of which the chief are Rewah, Urchal, Datia, and Samptar, yield to their rajahs a total yearly revenue of £2,016,222. In the W. are the peculiar Hindu tribes of Bandalas (hence *Bandalakhana*), and in Rewah in the E. are the Bhagelas (hence *Bhagalkhand*). See Malleon, *Native States of India* (Lond. 1875).

Bun'di, an ancient Rajput state, in the Haroti plain, has an area of 2291 sq. miles, a pop. of 220,000, and a yearly revenue of £50,000. In consequence of its exposed position it formerly suffered much from Mahratta inroads, which led to its forming a treaty for protection with the British Government, 10th February 1818, since when it has paid a tribute of £4000. B. maintains a military force of 2700 foot, 700 horse, and 12 guns. Its capital, a town of the same name, 150 miles S.W. of Gwalior, is the residence of the rajah, and has a splendid palace. The present heir of the principality was born in April 1872.

Bung'alow, from a Bengalese word describing a house of one storey either thatched or tiled, has come to have a variety of meanings. It is applied to the private residences of Europeans in India. These usually consist of only one storey, and they are invariably surrounded with a verandah; but sometimes they are palatial residences of two storeys. B. may mean in this respect, a lodge, a villa, a mansion. The term is applied to officers' quarters, and even to the soldiers' barracks at military stations. Beside private and military, there are public bungalows, maintained by Government along trunk-roads, for the accommodation of travellers. These are known as *Dak* ('post') bungalows. They mark a stage or day's journey, and stand generally about 12 or 15 miles distant from each other.

Bun'gay, a well-built market-town in the county of Suffolk, England, on the river Waveney, 31 miles N.N.E. of Ipswich, and a station on a branch of the Great Eastern Railway. Some ruins of a Benedictine nunnery and of a castle believed to have been built by the old Earls of Norfolk are still extant. B. has considerable river-trade in corn, malt, coals, and lime. The grammar school has four scholarships at Emmanuel College, Cambridge. Pop. (1871) 3503.

Bu'nias, a genus of plants of the natural order *Crucifera*, natives of Central Europe, temperate Asia, and the Levant. *B. orientalis*, sometimes called 'hill-mustard,' was introduced into Britain about one hundred years ago for the sake of its leaves, which are used for feeding cattle, but its cultivation has never become general.

Bun'kapur, a town of India, in the executive district of Dharwar, province of Bombay, southern division, about 180 miles S.S.E. of Bombay. Pop. (1871) 6400.

Bunk'er Hill, or **Bunk'er's Hill**, at Charleston, near Boston, together with Breed's Hill, is celebrated as the scene of the first battle in the war of American independence, June 17, 1775. In this battle the colonists fled as soon as their entrenchments were reached, but they were undisciplined and in inferior numbers. A commemorative column was erected on Breed's Hill.

Bunk'um, properly **Buncombe**, is an American political term. When a person speaks merely to get votes or popularity, either by advocating impossible measures, or by flattering the prejudices of the people and plausibly advancing their sentiments as his own, he is said to be talking *B.* The application of the term arose in this way:—A member of Congress from B. county (N. Carolina), which was named after Colonel E. B., a Revolutionary soldier, was in the habit of making speeches wide of the mark on some occasions in Congress. He was remonstrated with, but replied that he was talking to *B.* In this way speeches and motions are often made for the mere purpose of securing or increasing local popularity. The word, and unhappily the *thing* also, has spread to other countries than the United States.

Bun'sen, **Christian Karl Josias, Freiherr von**, a highly distinguished German diplomatist and scholar, was born at Korbach, 25th August 1791. He was educated at Marburg, and under Heyne at Göttingen. To prosecute his study of German dialects he travelled in Holland, and learned Icelandic at Copenhagen from Finn Magnussen. In 1815 he passed several months with Niebuhr at Berlin. After studying Persian and Arabic at Paris under Sylvestre de Sacy, he went in 1816 to Rome, where he married an English lady. In 1818 he became secretary to Niebuhr, then Prussian ambassador at the papal court; and when Niebuhr left Rome, B. succeeded him. During his long residence at Rome, he prosecuted his studies with untiring ardour, devoting special attention to the Platonic philosophy, to biblical criticism, Church history, and liturgies, and making numerous contributions to the topographical and archaeological *Beschreibung der Stadt Rom* (3 vols. Stuttg. 1830-43). In 1841 he was sent to England to promote the establishment of an English-German bishopric at Jerusalem, and was shortly afterwards appointed Prussian ambassador in this country. This high post he held for seventeen years, and he discharged his important functions with conspicuous fidelity, acceptability, and success. Many young scholars, both German and English, such as Max Müller, Birch, Curzon, owed much to his encouragement and advice. At the time of the Crimean war his sympathies were too decidedly English for the then Russian proclivities at Berlin, and he retired from the service of his country. In 1857, at the special request of the Prussian King, he took part in the famous Evangelical Alliance held at Berlin, and was soon after called to the Prussian House of Lords. B. passed the remaining years of his active and noble career in the prosecution of his favourite studies, chiefly at Heidelberg, but in the spring of 1860 settled at Bonn, where he died, 28th November of the same year. His chief works are *Ägyptens Stelle in der Weltgeschichte* (5 vols. Gotha, 1844-45); *Die Verfassung der Kirche der Zukunft* (Hamb. 1845); *Ignatius von Antiochien und seine Zeit* (Hamb. 1847); *Die Drei Echten und die Vier Unchten Briefe des Ignatius* (Hamb. 1847); *Hippolytus and his Times* (first in Eng. 4 vols. Lond. 1851; Ger. 2 vols. Leips. 1852-53); *Christianity and Mankind* (also first in Eng. 7 vols. Lond. 1854); *Gott in der Geschichte* (3 vols. Leips. 1857-58); *Bibelwerk für die Gemeinde* (Leips. 1858). Depth of learning, acuteness and candour of judgment, catholicity of spirit, and a piety in which no superstition lurked, were the leading characteristics of this variously-gifted man. His literary talent, however, was not equal to his scholarship. It has also been said, probably with some truth, that he attempted too much and settled too little; but when all necessary abatements are made, his achievements constitute a massive monument of Teutonic industry and intellect. See *Memoir of Baron B.*, by his Widow (2d ed. Lond. 1869), and *His Life and Letters of Frances, Baroness B.* (Lond. 1878). Of B.'s five sons, the first, **Heinrich von B.** (born 1818), has become a clergyman in the Church of England; and the second, **Ernst von B.** (born 1819), has won a place in literature by his work *The Hidden Wisdom of Christ and the Key of Knowledge* (Lond. 1864).

Bunsen, **Robert Wilhelm Eberard**, a world-famous chemist, born March 31, 1811, at Göttingen, in Hanover, where his father was a University professor. After studying natural and physical science in his native town, B. went in succession to the Universities of Paris, Berlin, and Vienna. Returning to Göttingen in 1833, he settled there as a lecturer in chemistry, but three years later was elected successor to Wöhler in the Chemistry chair of the Polytechnic Institute at Cassel. He

became professor at Marburg in 1838, at Breslau in 1851, and finally at Heidelberg in 1852. B.'s name is familiar to all students of chemistry in connection with his burner, which, combining simplicity of structure with perfect combustion, and the possibility of getting all degrees of heat under a certain limit, is an indispensable instrument in the laboratory. He has further extended the application of spectrum-analysis; and, among many other important discoveries, has found out an antidote for arsenic acid. As a lecturer he stands pre-eminent, attracting many foreign students to Heidelberg University. His chief works are *Eisenoxyd, ein Gegengift der Arsenigen Säure* (2d ed. 1837); *Ueber eine Volumetrische Methode von sehr Allgem. Anwendung* (1854); *Gasometrische Methoden* (1857); and *Chemische Analyse durch Spektralbeobachtung* (with Kirchhoff, 1861); besides which, he has printed numerous papers and memoirs in the scientific journals of Germany.

Bunt, a disease of wheat produced by parasitic fungi, which gives the ear the appearance of being *burnt*, hence, probably, the popular name of the disease. The species which produces it is *Tilletia caries*, which occupies the whole farinaceous portion of the grains of wheat.

It is now less common than formerly, owing to farmers using more care in the selection of clean seed, dressing the seed before sowing with salt, quicklime, Glauber's salts (sulphate of soda), blue vitriol, &c., or some other solution, which, while it destroys the spores of the fungus, does not injure the vitality of the seed. Arsenic and corrosive sublimate are even used, and washing with water is also useful. Wheat affected with B. is dark, but not absolutely unwholesome; the flour is said to be largely used in the manufacture of gingerbread.

Bunter Sandstein, the name applied to the series of strata forming the lower or older portions of the Triassic system of rocks. This name means 'variegated sandstone,' and has been applied to these beds by the German geologists from the typical development of the trias in that country. It forms the *Grès bigarré* of the French *savants*, and consists of a red and white sandstone, interstratified with red-coloured marls and bands of limestone, which latter may be of Oolitic or magnesian kind. The characteristic fossils of the B. S. consist of ferns, cycads, and conifers—especially plentiful near Strasburg—of a fish (*Acrodus Braunii*), and of reptiles such as *Trematosaurus*, *Nothosaurus*, *Placodus*, footprints of *Labyrinthodon*, &c. The B. S. is represented in Britain and elsewhere.

Buntine, or **Bunting**, a thin woollen fabric usually employed to make the flags and signals of ships.

Bunting (*Emberiza*), a genus of Insectorial birds allied to the finches, and forming the type of the sub-family *Emberizinae*.

Bunting.

The bill is acute and conical; the ridge of the upper mandible is nearly straight, and the margins are wavy or inflected. The palate possesses a knob or blunt process for crushing seeds, &c. The wings are of moderate length, and the hinder toe is longer than the inner digit. The buntings occur in both Old and New Worlds, and feed and build their nests on the ground or amid low grasses. The food consists of seeds and insects. The corn or common B. (*Emberiza miliaris*) is the common species, and is found throughout Europe and in Asia. These birds congregate in flocks in winter to feed on the seeds of the corn-fields. This species is larger than a sparrow, and is coloured brown above, with darker streaks; and light yellow, or whitish-brown, with dark-brown markings below. The tail is slightly forked or divided. The black-headed or red B. (*E. Shanichus*) is also a British and European species; the throat and head being black, and the nape and sides of the neck white. The black-throated B. (*E. Americana*) is a N. American species, which inhabits the Southern States permanently, and migrates northwards in summer. The snow B. (q. v.) (*E. nivalis*), sometimes included in a distinct genus as *Plectrophanes nivalis*, inhabits the Arctic regions during the breeding season,

and flies southwards in winter to the Saskatchewan river. The Cirl B. (*Emberiza ciris*) inhabits S. Europe, N. Africa, and is rare in Britain. The head is of a dark or olive-green colour, streaked with black, and with yellow patches over the eyes and cheeks. The Ortolan (q. v.) (*E. hortulana*) and Yellow-hammer (q. v.) (*E. citrinella*) are also members of the B. genus. The Lapland B. (*Plectrophanes Lapponica*) is another form included in the same genus as the snow B., and inhabiting N. Europe and Siberia.

Bunt'ing, Jabez, a distinguished Wesleyan-Methodist minister, was born at Manchester, 1779. Known to the world as a philanthropist and eloquent preacher, his talents as an administrator contributed largely to the prosperity of his own sect. After having been four times President of the Conference, he retired from public life in 1857, and died June 1858.

Bunyan, John, was born at Elstow, near Bedford, in 1628. For some years he followed his father's trade, that of a travelling tinker. It was at one time believed that he had been very profligate in early life, from some strong self-accusatory passages in his writings; but, as the only vices which he really confesses to are swearing and Sabbath-breaking, the general opinion now is that his account of himself is mainly a religious over-statement. After a short service in the Parliamentary army, he married at the age of nineteen. His marriage was followed by his conversion, or religious 'awakening.' In 1655 he became a member of the Baptist congregation at Bedford, and, subsequently, its pastor. After the Restoration, he was convicted under the Act against Conventicles (1660), and thrown into Bedford Jail, where he remained for upwards of eleven years, supporting his family by making tagged laces, and writing *The Pilgrim's Progress*. Through the interposition of Dr Barlow, Bishop of Lincoln, he was released from prison (March 1672), becoming again pastor of the Bedford congregation. This position he held till his death, which took place, of fever, in London, 31st August 1688. B.'s *Pilgrim's Progress* is admittedly the first of allegories, and, even of its style, Macaulay says, 'There is no book in our literature on which we would so readily stake the fame of the old, unpolluted English language—no book which shows so well how rich that language is in its own proper wealth, and how little it has been improved by all that it has borrowed.' Of B.'s other works, the chief are his *Grace Abounding to the Chief of Sinners*, an autobiography, and the *Holy War*, another allegory, very inferior, however, to the *Pilgrim's Progress*. He is also the author of a vol. of verse, entitled *Divine Emblems*. The best edition of B.'s works, is Offer's (3 vols. Lond. 1853).—**Robert B.**, the last lineal descendant of John, died at Lincoln, November 27, 1855.

Bunzlau, a town of Prussia, province of Silesia, on the right bank of the Bober, 25 miles W. of Liegnitz. It is surrounded by walls and bastions, and has four suburbs. B. has an orphanage, a training school for teachers, a gymnasium (1862), and a large lunatic asylum (1863). In the market-place there is an obelisk in cast-iron, erected in memory of the Russian field-marshal Kutuzow, who died here, 28th April 1813. The town has manufactures of cottons, linens, tobacco, earthenware, and is also noted for its orchards. Pop. (1869) 8812. B. is the birth-place of the German poets Opitz and Tscherning.—**B. Jung** (Czech. *Mladá Boleslav*), a town of Bohemia, Austria, on the Iser, 32 miles N.E. of Prague, has important cotton manufactures. It is said to have been founded by King Boleslav in the 10th c. B. has several fine churches, and a handsome town-house. Pop. (1869) 8695, of whom many are Jews.

Bu'ol-Schau'enstein, an ancient and noble family, belonging originally to the Grisons, which for upwards of 200 years has furnished a succession of statesmen and soldiers to the Austrian service. The one who interests Englishmen most is **Karl Ferdinand, Count von B.**, who was born 17th May 1797, and who at an early age entered on a diplomatic career. After filling with prudence and tact several minor posts, he was sent as Austrian ambassador to Turin in 1844, to St Petersburg in 1848, and to London in 1851. Wherever he was sent, B. successfully upheld the interest and dignity of his country. In 1852 he was recalled to Vienna, and became foreign minister, in which office he displayed great ability, both during and after the Crimean war. At the commencement of the Italian campaign of 1859, B. resigned this office, owing, it is believed, to

the triumph of the policy of the war-party. He died at Vienna, October 28, 1865.

Buonarotti, Michael Angelo—the greatest name in art—was born at Chiusi, in Italy, March 6, 1475, and was descended on his mother's side from the noble Tuscan family of Canossa. He studied design in the school of Ghirlandaio of Florence, afterwards entered the school of sculpture established by Lorenzo de' Medici, at Florence, and there so distinguished himself by restoring the mutilated head of a laughing fawn, that he was invited to live and study in the Medici palace, where he remained three years. His statue, the 'Sleeping Cupid,' executed about 1494-95, was sent to Rome, exhibited there as an antique, and was accepted by the connoisseurs as genuine, and as superior to anything in contemporary art. Shortly afterwards the real history of the work became known, and the now famous sculptor was invited to Rome (1508), where he studied intensely, and executed the 'Mater Dolorosa,' a great group, placed in St Peter's. Returning to Florence, he executed for the ducal palace, to which Da Vinci painted a pendant, his great cartoon of the hostile Pisans surprising young Florentines while bathing in the Arno. This work, of which only a few fragments remain, was said by Benvenuto Cellini to have been B.'s *chef-d'œuvre*. It created a new era in the arts, by the marvellous power with which figures of men and horses, in every variety of attitude, were drawn, and by its grandeur and force. Pope Julius II. now became the patron of B., who designed for him a tomb of such grand proportions that the Pope resolved to have St Peter's rebuilt on the enlarged and noble plan of the existing building, that the monument should have a fitting shrine. Julius afterwards induced B. to paint the ceiling of the Sistine Chapel, which he did with his own hand in twenty months, filling the twelve compartments of the roof with splendid designs illustrating the history of the antediluvian world, and thus completing a work of imperishable renown, and one on which alone his fame as the greatest of artists, in the quality of grandeur of conception, might safely be based. His 'Last Judgment,' painted for the altar of the Sistine Chapel, and completed in 1541, was regarded as the greatest of his works. He now devoted himself to the reconstruction of St Peter's, which he converted from an incongruous structure into the noblest and most beautiful of Christian temples. After having thus raised himself to the first rank in art as painter, sculptor, and architect, and shown the versatility of his genius by the composition of some admirable verse, B. died at Rome, 17th February 1563, and was buried within the church of Santa Croce, at Florence. The fourth celebration of the centenary of the birth of B. was celebrated on the 24th September 1875, at Florence, where many distinguished representatives of Continental and British art assembled to honour the memory of the great sculptor with becoming rites and festivities. B.'s *Rime* have been repeatedly published, notably by his grandnephew and namesake (Flor. 1623), and by Guasti (Flor. 1863; Eng. by Symonds, 1878). See the *Lives* by Vasari (1550), Condivi (1553), Grimm (3d ed. 1868), and by Aurelio Gotti (2 vols. Flor. 1875). This last work contains a series of most interesting letters by the great artist, together with many curious documents of the B. family, collected and published for the first time.

Buoy, a floating body used as a mark for and by sailors for various objects, as to mark the position of the anchor, the existence of rocks or sandbanks, the direction of a navigable channel, &c. They are of various shapes, but are now very commonly made of hollow chambers of wrought-iron plates riveted together.

Buoy Dues. Ships entering certain ports are charged so much for what are called B. D.; this is sometimes a fraction per ton on the vessel, or so much per vessel, perhaps from a few pence to a few shillings.

Buprestis, a genus of *Coleoptera*, or beetles, belonging to the *Pentamerous* section of the order, and forming the type of the family *Buprestidae*. This family includes a large number of species, chiefly found in tropical regions, and remarkable for the brilliancy and metallic lustre of their colours. Several species are English or European. The *B. gigas* of Cayenne, or giant B., averages two inches in length, and has the thorax or chest of a cuprous colour mingled with brilliant green. Two large spots like burnished steel also ornament the chest. *B. fasciculata* averages an inch in length, and is of a golden-green colour, with

tufts of reddish and yellow iridescent hairs. These beetles are mostly diurnal in habits, and the lustrous *elytra*, or wing-covers, appear to be used by the natives of tropical regions as articles of decoration. *B. bicolor* is another familiar species. These beetles are liable to be attacked by other insects (*Cerceris*), such as wasps, the larvae of the latter feeding on the beetles.

Bura'no, an Italian lagoon-island and fishing-town on the Adriatic, 5 miles N.E. of Venice. The former is noted for its vegetables, and the latter for its lace. Pop. 5700.

Burbot (*Lota vulgaris*), a Teleostean fish, included in the Ling genus (*Lota*), and in the Cod family (*Gadidae*). This fish occurs in fresh-water rivers and lakes of Europe and Asia, and is thus found in the Trent, Cam, and other English streams. The body is more elongated than in the ling, whence it has received the local name of 'Eelpout.' The first dorsal fin is short, the second greatly elongated, as also is the anal fin. The tail fin is oval, convex, or pointed. It possesses a single barbule on the lower jaw. The colours are light brown, the scales being small. The B. attains a weight of from 2 or 3 to 8 or even 12 lbs; and its flesh is said to be very palatable, although the fish has yet to become generally known as a food-fish. It feeds on worms, small fry, molluscs, &c. The liver yields an oil analogous to cod-liver oil.

Burbot.

Burckhardt, John Lewis, an intrepid and very observant traveller, was born at Lausanne, Switzerland, November 24, 1784. Coming to London in 1806, he offered the African Association his services in 1808 to explore the interior of Africa. Having studied Arabic for a time at Cambridge, he sailed for Aleppo in the spring of 1809, where he assumed an Oriental name and costume, spent two years and a half in Syria learning the various dialects and customs of the people, and then visited Cairo to arrange for accompanying the caravan to Fezzan, and across the Sahara to Soudan. Meantime, he travelled through the Nubian Desert, and crossed the Red Sea to Mecca, where he remained four months. He returned again to Cairo in 1815, and in the following spring ascended Mount Sinai. At length the Fezzan caravan was ready to set out, and B. to go with it, when he was seized with dysentery at Cairo, and died October 17, 1817. He left his collection of 350 Oriental MSS. to Cambridge University. After his death the African Association published his interesting journals of travel. Perhaps the most important of these are his *Notes on the Bedouins and Wahabys* (Lond. 1830), and *Arabic Proverbs* (Lond. 1831).

Burden, or Burthen. See TONNAGE.

Burden, in Scotch law, signifies any restriction, limitation, or encumbrance affecting the person or property. Burdens are accordingly personal or real. Where a subject is conveyed to any one who, by acceptance of the conveyance, binds himself to pay a sum of money to the grantor of it, there being no clause charging the subject conveyed with the sum, the B. is personal; that is, it will be binding upon the receiver and his representatives, but will constitute no incumbrance on the lands or other subject conveyed. But where the right is expressly granted under the B. of a specific sum, which is declared a B. on the subject itself, or where the right is declared null if the sum be not paid, the B. is real.

Burden of Proof, or Onus Probandi, means, in law, the obligation to prove a fact or allegation, denied or not admitted. The general rule is that he who affirms must prove his affirmation; but this rule in its application often leads to questions of great nicety and importance; since on the question of, on whom does the proof lie? will frequently depend the issue of a litigation. In a civil case the solution may probably be found in considering which litigant ought to win in the absence of any evidence, or having regard to evidence so far as it has been given. In a criminal case, the B. of P. lies wholly on the prosecutor, if the prisoner plead *not guilty*.

Burdens, Public. See PUBLIC BURDENS.

Burder, Rev. George, a popular Congregational clergyman, born in London, 5th June 1752. After occupying impor-

tant ministerial positions in Lancaster and Coventry, he was translated to London in 1803, and was subsequently appointed to the editorship of the *Evangelical Magazine*. B. was one of the principals in forming the London Missionary Society, and projected the Religious Tract Society. He died 29th May 1832. His *Village Sermons* are still popular.

Burdett', Sir Francis, Bart., a popular English politician, was born January 25, 1770, and educated at Oxford. On the death of his grandfather in 1797, he succeeded to the family baronetcy. The most important part of his life was his parliamentary career. He sat first for Boroughbridge, next for Middlesex, and in 1807 for Westminster. Being the advocate of parliamentary reform, Catholic emancipation, and other liberal measures, he was a great favourite in the metropolis. B.'s life was a stormy one. On one occasion, after a struggle between the populace and the police, in which some lives were lost, he was imprisoned in the Tower, on account of a letter which he published in Cobbett's *Political Register*, and in 1819, for a letter reflecting on the conduct of the magistrates and yeomanry at the celebrated Manchester meeting, he was sentenced to three months' imprisonment in the Queen's Bench, as well as to pay a fine of £1000. In his later years he became a Conservative, and represented Wiltshire. He died January 23, 1844. B. married, in 1793, Sophia the youngest daughter of Thomas Coutts, the celebrated London banker. His daughter, Angela Georgina, Baroness B.-Coutts, born 25th April 1814, is honourably known as one of the wisest philanthropists of the present time.

Burdock, or Burdocken (*Arctium Lappa*), a plant belonging to the natural order *Compositæ*, found in waste places, roadsides, &c., 'all over Europe and Russian Asia, except the extreme N., and naturalised in other parts of the world.' It is common in Britain. Five distinct species of B. have been described as British, but, according to Bentham, they are separated by too slight characters to be entitled to the distinction given them. The root causes perspiration, and can be used as a substitute for sarsaparilla. It smells disagreeably when fresh, but is inodorous when dry. The roots, young shoots, and young leaves are used in soups in some countries, especially in Japan, where it is cultivated for this use. The roots resemble artichokes in taste.

Burdwan', capital of an executive district of a division or commissionership of the same name in the province of Bengal, on the Dammuda, a tributary of the Hoogly, 74 miles N.W. of Calcutta. It is an important junction on the East Indian Railway, and has an active export trade, chiefly in coal, iron, and sugar. Pop. (1872) 32,321. The district of B. is singularly fertile, and has an area of 3523 sq. miles; pop. (1872) 2,034,745.

Bureau' (Fr. a 'writing-table,' so called from the woollen baize, Lat. *burra*, with which it was covered), now denotes an office for public business, also a department of government, and even the officials of a department. Hence *Bureaucracy* is applied to a government by heads of departments, as distinguished from a government in which such officers have only subordinate authority.

Buren, Martin Van, the eighth President of the United States, was born at Kinderhook, New York, December 5, 1782. He entered the New York Legislature in 1812, and Congress in 1821, as a supporter of the Democratic party. He was successively senator, Secretary of State, Governor of New York, and Vice-President. B. was President one term (1837-41), succeeding his leader, Jackson, and gaining the election over Clay, Webster, and Harrison. The great financial crisis which occurred in 1837 involved the Administration in trouble, and the old Whig party under Harrison defeated B. in 1841. B. divided his party in 1848, and again ran for the presidency, but was once more defeated by General Taylor. He died 24th July 1862. B. was an adroit and politic public man.

Bureng', a valley and river near the Pir Panjal mountain, in Cashmere, some 40 miles S.W. of the town of Cashmere. At a certain point of its course the river disappears beneath the surface of the valley, which is remarkable for its numerous caves and subterranean watercourses.

Burg, a town in the province of Saxony, Prussia, on both banks of the Ihle, 13 miles N.E. of Magdeburg. It is on the

Berlin and Magdeburg Railway, and has eleven large woollen-cloth factories, employing 9843 hands, besides which there is much linen-weaving, machine-making, fulling, dyeing, &c. Pop. (1871) 15,184, of whom many are descendants of colonists from Belgium and the French Palatinate. In one of its four churches the service is still in the French tongue.

Bur'gage Tenure, in England, is the tenure by which all tenements in *burghs* or walled towns were formerly held, and which is not entirely lost. The tenure was a rent certain, payable to the king or lord to whom he had granted it; and differed nothing in effect from Socage (q. v.) tenure. The citizens of London held in B. T. of the crown, till they had a grant to hold in free burgage, or common socage. In Scotland, B. T. is originally constituted by a charter from the crown in favour of the burgh; the effect of which is to make every holder of property situated within the burgh hold directly under the crown as superior, for the *reddendo* (now merely nominal) of watching and warding; or, as it is commonly termed, 'service of burgh, used and wont.'

Burgas', or Burghaz', one of the most important havens of European Turkey, on the Black Sea, to the S.E. of the Balkan range, vilayet of Adrianople, 76 miles N.E. of Adrianople. It has a large export trade, mainly in wool, talc, cheese, and rose-water. Pop. 5000, chiefly Greeks and Turks. B. is the *Pyrgos* of the middle ages. To the N.W. is the much-frequented watering-place of Litzni. The Gulf of B., a beautiful inlet, receives the Mandra, and measures 14 miles across, having a depth of some five fathoms.

Bur'geo Islands, a group of islets between Newfoundland and Cape Breton, at the entrance to the Gulf of St. Lawrence. They belong to Britain, and have a pop. of about 700, principally engaged in fishing.

Bürger, Gottfried August, one of the best of the German lyric poets, was born 1st January 1748, at Molmerswende, Prussian Saxony, and studied at Halle (1764) and at Göttingen (1768). There he led the life of a libertine, but the reproaches of his friends Voss and the Stolbergs, and the study of the ballad compositions of Schiller, Schlegel, Uhland, and especially of *Percy's Reliques*, inspired him with the desire to win a reputation in literature; but his years were passed in want and misery. He died 8th June 1794. B.'s ballads and lyric poems are extremely popular in his native country, and those which have been translated into English, as Scott's *William and Helen* from the *Lenore* volume (1794), and the *Wild Huntsman*, have found many admirers. His *Sonnets*, the first in German literature since the days of Gottsched, obtained the praise even of the unfriendly Schiller. His *Sämmtliche Werke* were published at Göttingen by Karl von Reinhard (4 vols. 1796-98; new ed. 1844). His life has been written by Döring in the Berlin edition of B.'s works (7 vols. 1824-25), and by Prohle (Leips. 1856).

Bürgermeister, the German title given to the chief magistrate of a municipality. It answers to the English *mayor*, Scotch *provost*, French *maire*, Spanish *alcalde*, Swiss *landamman*. In the free towns of Germany, the B. was something more than mayor, being president of the administrative council of the republic.

Burgess. Municipal or town corporations in England, except that of London, are now regulated by 5 and 6 Will. IV., c. 76. Under this statute, the government of a borough is vested in the freemen or burgesses existing at the passing of the Act, September 9, 1835. To be a B., a man must be of full age; he must have occupied a house or other premises in the borough for two years previous to the last day of August in each year; he must have been an inhabitant householder in the borough, or within seven miles of it; he must have been duly enrolled and rated for the relief of the poor; he must have paid his rates and taxes, except so far as they fell due within six months before 31st August.

In Scotland, B. is defined as a member of the corporation of a burgh, admitted either by the charter of erection or by birth, as being the son of a B., or by serving an apprenticeship to a B., or by marrying the daughter of a B., or by election of a magistrate of the burgh.—*Ball's Dictionary*.

Burgess Roll.—Overseers are required to make out a list of burgesses for each year by 1st September; the list is to be open

to inspection, without fee, till 13th September. The town-clerk is required to exhibit the list on the outer door of the town-hall, or some other conspicuous place, for one week previous to 15th September; burgesses omitted must give notice on or before the 15th. Lists of claimants, and persons objected to, to be published during the eight days before 1st October.

Burgh, in Scotland, corresponds to the English word *Borough* (q. v.). Before the Reform Bill of 1832, no B. in Scotland had any parliamentary representation as a B., except those constituted by royal charter. (See ROYAL BURGH.) By that bill, however, there have been created what are called *parliamentary burghs*, that is, towns which are not royal burghs sending members to Parliament, or so doing in conjunction with other towns. Of these there are fifteen, whose parliamentary representation is regulated by the Act above referred to, and by the Reform Act of 1868. They are Airdrie, Cromarty, Falkirk, Galashiels, Greenock, Hamilton, Hawick, Kilmarnock, Leith, Musselburgh, Oban, Paisley, Peterhead, Port-Glasgow, and Portobello. Before 1832, the Scotch burghal franchise was vested in the town councils. The Act of 1832 conferred it on householders paying a yearly rent of £10. Under the Act of 1868, all occupiers of houses in burghs paying taxes are enfranchised.

Burgh of Barony and Burgh of Regality.—There is now no practical distinction between a B. of 'barony' and of 'regality.' They are municipally governed by magistrates, either nominated by the baron or lord of the district, or chosen by the inhabitants themselves.

Burgh, Royal.—A royal burgh is a corporate body, constituted by a charter from the crown. The corporation consists of the magistrates and burgesses of the territory erected into a B. The magistrates are generally a Provost (q. v.) and bailies (see BAILIE), Dean of Guild (q. v.), treasurer, and common council. At the Union of England and Scotland there were seventy royal burghs in Scotland; of these, there were four in the county of Fife which did not send representatives to the Scotch Parliament. Between the date of the Union and the passing of the Reform Bill of 1832, Peebles and Rothesay had, as burghs, a share in parliamentary representation. This they have not had since 1832, their constituencies voting in their respective counties. Under Acts of Parliament passed since 1832, a new constitution has been given to the royal burghs, nine being excepted from the operation of the Act, on account of the smallness of their population. In the larger burghs, every one is now entitled to vote in the election of councillors who has been a resident for six calendar months next previous to the last day of June within the royalty, or within seven miles of it, and who is qualified by 2 and 3 Will. IV., c. 65, in respect of property or occupancy of premises within the B. to vote in the election of members of Parliament. In burghs which do not now send members to Parliament, property of the same value is required for the qualification. The councillors are chosen from the electors residing or personally carrying on business within the royalty; and where there is a body of burgesses in the B., each councillor, before his induction, must be entered a Burgess. This requisite will, it is expected, soon be done away with.

Burgh Acres are acres or small patches of land in the neighbourhood of royal burghs, usually *feued* (see FEU) to and occupied by burgesses or residents of the B.

Burghers. See UNITED PRESBYTERIAN CHURCH.

Burghs, Convention of Royal. By a statute of 1487, royal burghs are ordered to meet by commissioners once a year, to discuss questions connected with trade and the general welfare of the public, and to suggest remedial measures. The convention does not, however, seem ever to have had much legal authority; its deliberations have consequently never excited any strong general interest. It still meets annually in Edinburgh on the second Tuesday of July.

Burgh'mair, a family of German artists in the 15th and 16th centuries, the founder of which was a **Thomas B.**, whose name first appears in 1460 as an Augsburg painter. By far the most notable genius of the family, however, was **Hans B.**, painter and engraver, who was born at Augsburg in 1472, was the pupil of Dürer, and the father-in-law of Holbein. His fame rests upon his engravings, about 700 in number, many of them

grouped in separate series, of which the chief are the 'Ancestors of the Emperor Maximilian I.,' 77 plates; 'Triumph of Maximilian,' 135 plates; 'The Wise King, or the Acts of Maximilian,' 250 plates. Hans died in 1531.—His sons, **Friedrich** and **Hans**, were also painters, but inferior to their father. The latter, who was still alive in 1559, is best known by his finely painted *Book of the Tournament*, in the collection of the Hohen-zollern-Sigmaringen family.

Burglary, in the law of England, is the breaking into of a dwelling-house *by night*, any one being in it, and is punishable under the statute 24 and 25 Vict., c. 96, by penal servitude for life, or not less than three years, or imprisonment for not above two years, with or without hard labour.

By the statute, *night* is from 9 P.M. to 6 A.M. No building within the same curtilage is to be held as part of a dwelling-house, unless there be a passage between. Any one found *during the night* in a house, armed with a dangerous weapon or implement of housebreaking, or having his face disguised, is guilty of a misdemeanour, and is liable to imprisonment, with or without hard labour, for three years.

To constitute B. the breaking must be in the *night*. It must be in a dwelling-house. There must be *entry* with a felonious intent. Entry by day and breaking out by night is B. If a servant enters his master's room with felonious intent, he commits B. It cannot be committed in a tent or booth, though the owner lodge in it. The crime can only be committed in a permanent building. See HOUSEBREAKING.

Bürklen, a Swiss village in the canton of Uri, with a pop. (1870) of 1391, is the birthplace of William Tell. A chapel now stands on the supposed site of the patriot's house, and its walls are adorned with representations of scenes from his life.

Burgos ('the fort or castle'), a city of Northern Spain, capital of the province of B., on the right bank of the Arlanzon, at the foot of the Sierra d'Oka, about 145 miles N. of Madrid. It is a fortress of the first rank, the headquarters of a captain-general, the seat of a cardinal-archbishop, and of several judicial and military courts. B. is separated by the river from its suburbs La Vega, Las Huelgas, and San Pedro. It has numerous churches, of which the finest is the cathedral (built in the 13th c.), the glory of the town, and one of the most splendid structures in Spain. As the centre of the great roads to Madrid, Valladolid, Santander, Bilbao, and France, and also connected by railway with Tolosa, Vittoria, San Sebastian, and Irun, on the French frontier, it is a place of considerable traffic. It has, besides, a trade in woollen cloths, linens, hats, and leather. In the castle of B., Edward I. of England was married to Eleanor of Castile. The town is memorable in the Peninsular war for the annihilation of the Spanish army by Soult in 1808; as well as for the repeated attempts of Wellington to storm it in September and October 1812. Pop. 27,000. The province of B. has an area of 5628 sq. miles. Pop. (1870) 353,560.

Burgoyne, Sir John Fox, Bart., a distinguished British officer and engineer, was born in London, 24th July 1782. He entered the Royal Engineers in 1798, served in the Peninsula under both Moore and Wellington, taking an active part in the sieges of San Sebastian and Burgos. He was also, in 1814, the commanding engineer of the expedition to New Orleans. During the Crimean War he was head of the engineering department, until recalled in 1855. B. filled various offices, both at home and abroad, of honour and emolument, including that of inspector-general of fortifications, was made general in 1855, and baronet in 1856. He died October 7, 1871. See his *Life* by Colonel Wrottesley (Lond. 1873).

Burgoyne, John, a British general, was the natural son of Lord Bingley, and was born about 1730. He entered the army at an early age, proved himself to be a brave officer, and in 1762 showed very considerable skill and enterprise as commander of a portion of the British troops in Portugal and Spain, capturing Alcantara. In the American war of independence, he led the army which was to penetrate from Canada into the revolted provinces, but being misled by an apparent retreat on the part of his opponents, and failing to maintain his communications with Canada, was compelled to surrender to Generals Gates and Arnold at Saratoga. He returned to England, and being offended with the Ministry of the time on

account of his having been refused a court-martial and an audience of the king, he went over to the Opposition, and threw up his appointments. On a change of Ministry he became commander-in-chief in Ireland, an office which he held for two years. He now devoted himself to literature, and produced four dramas, *The Heiress*, *The Maid of the Oaks*, *The Lord of the Manor*, and *Richard Cœur de Lion*, besides a probationary ode and some pamphlets in his own defence. B. was one of the managers of the impeachment of Warren Hastings, but died June 4, 1792, before the trial was concluded. His writings were published in 2 vols. in 1808.

Burgundy (Fr. *Burgogne*) is a name that has not always been given to the same extent of territory, nor to the same kind of state. Its different uses, both geographical and political, will appear in the course of the article, but it may here be noted that the name is best known to Englishmen as that of a sovereign duchy, and afterwards of a province in the E. of France, in the basins of the Seine, the Loire, and Rhone, now represented by the departments of Côte d'Or, Yonne (in part), Saône-Loire, and Ain, with an area of nearly 12,000 sq. miles, and a pop. (1872) of 1,699,752. This region, also called Lower B., in contradistinction to Upper B., or *Franche Comté*, is full of fertile plains and soft rounded hills, has an extensive culture of the vine (see **BURGUNDY WINES**), numerous and flourishing industries, great mineral wealth (iron, lead, coal, &c.), and many important towns, as Dijon, Châlons-sur-Saône, Autun, Auxerre, Auxonne, and Bourg.

Kingdom of B.—The Burgundians (*Burgundii* and *Burgundiones*), a Germanic people, originally settled on the banks of the Vistula and Oder, wandered S. W. into the Neckar and Rhineland district, and about the year 407, under their king Gundicar, burst into Roman Gaul, 80,000 strong, seized the lands between the Aar (in mod. Switzerland), and the Rhone, accepted the Arian form of Christianity, and so founded the *Old Burgundian kingdom*. They proved a thrifty, peaceful, and kindly race, and were rather liked by the Gallo-Romans, whom they had mastered. Gundicar, according to the *Nibelungenlied*, fell in the great battle against Attila on the plain of Châlons in 451. To a later Burgundian king, Gundebald, we owe the code known as the *Lex Gundobaldi*. In a struggle with the Frankish kings Childebert and Chlotair, the Burgundian Godemar lost his life and crown in 534, and B. became a province of the Frankish kingdom. On the death of Chlotair in 567, the Frankish kingdom was divided into four parts, of which B. was one. Its limits at this period are not very clearly defined, but it embraced Western Switzerland, and the valleys of the Saône and Rhone almost to the Mediterranean. See Binding's *Geschichte der Burgund. Röm. Königr.* (1863), and Kitchin's *History of France* (Lond. 1873), which contains maps of the greatest value to the student. The land won back its independence through Count Boso of Vienne, who in 879 made himself king of the *Cis-Jurane* kingdom of B. or Arelat (Arles), and through Count Rudolf I. of the Guelph family, who in 899 was made king of *Trans-Jurane* B. Both acknowledged the Emperor of Germany as their 'over-lord.' Rudolf II., son of the latter, in 930 united both parts of the Burgundian kingdom. His grandson, Rudolf III. (died 1032), appointed as his heir the Emperor Heinrich II. (died 1024), son of his sister Gisela, and after him the Emperor Konrad II., his grand-nephew, passing over his nephew Odo of Champagne. Heinrich III., however, son of Heinrich II., was at an imperial diet held at Solothurn in 1038 formally elected and crowned king of B. From this time B. belonged to the German Empire, and was under hereditary rulers. Friedrich Barbarossa, who was crowned at Arles in 1178, brought B. into the closest union with the empire. But after the death (1378) of Karl IV., the last of the German emperors crowned at Arles, the kingdom of B. was broken up into several independent territories, which gradually, with the exception of Savoy and Mömpelgard, fell to France. Up to this point, the history and politics of B. are strictly German.

Duchy of B.—This was founded by Richard, Count of Autun (brother of Boso of Vienne), who died in 921. His son, Rudolf, died in 936 without heirs; but a grand-daughter, Ludgardis, having married Odo, brother of the French king, Hugo Capet, and owner of part of B., the whole was reunited. From Odo are descended the earlier Dukes of B., whose line became extinct in 1361 in the person of Duke Philippe, whereupon King Jean of France annexed the duchy to the French crown, but

soon after (1363) gave it to his youngest son, Philippe the Hardy, who became the founder of the later Dukes of B., and through his marriage (1369) with Marguerite, Comtesse de Flandres, obtained not only that county, but also Mecheln, Antwerp, and Franche Comté. His son, Jean, caused the Duc d'Orleans to be murdered in 1407, and was himself murdered (1419) at the instigation of the Dauphin. He was succeeded by his son, Philippe the Good, who acquired Namur (1429), then Hainault, Holland, Zealand, Brabant and Limburg by the peace of Arras (1435), important cessions of French territory, and in 1443 the duchy of Luxembourg. He died in 1467. His son, Charles the Bold or Rash (q. v.), added to his multiplex dominions Gueldres and Zutphen (1473), but left no male heir. Louis XI. immediately annexed the duchy of B. to the French crown, and it continued a province of France down to the Revolution, when, like the other provinces, it was cut up into departments. The other hereditary possessions of Charles—viz., the Netherlands—went to his daughter Marie, who married the Archduke Maximilian of Austria, and, through their grandson, the Emperor Charles V., were brought into unhappy connection with Spain, but their history forms no part of that of B. proper. It may be noticed that Franche Comté, or Upper B., was given to Maximilian in 1493, and that it was only restored to France by the peace of Nymwegen in 1678. See Barante, *Histoire des Ducs de Bourgogne* (8th ed. 1858), and Dubois, *La Bourgogne depuis son Origine* (1863).

Burgundy, Louis, Duke of, grandson of Louis XIV., was born at Versailles, 6th August 1682. He displayed from his earliest years a passionate, cruel, and brutal character, which, as he advanced in years, developed into one of boundless licentiousness. The Duc de Beauvilliers was charged with the task of effecting a reformation. He called Fénelon and Fleury to his aid, and according to the courtly Saint Simon they completely succeeded. Other reports, however, are less favourable. In 1697 Louis, who was deformed from his birth, married Marie-Adelaide of Savoy, and henceforth wasted his time in the most frivolous amusements; so that, when called to command the army of Germany in 1701, his miserable failures hardly excited surprise. He became the jest of his own soldiers, and soon withdrew to court. On the death of his father in 1711, he became immediate heir to the crown, but died suddenly, 18th February 1712, six days after his wife and their son, the Duke of Bretagne, and all three were conveyed to St Denis in the same hearse. That a character radically so weak and vicious should have become as transformed as Saint Simon, Fleury, and especially Père Martineau, the Duke's Jesuit confessor, author of a volume entitled *Les Vertus du Duc de Bourgogne*, assert, is less credible than that the heir of France, stricken down so suddenly, should find among courtiers not only apologists, but eulogists.

Burgundy Pitch, a resinous exudation collected from the stem of the spruce fir (*Abies excelsa*). Pure B. P. is a yellow opaque substance, hard and brittle when cold, with an agreeable aromatic odour. It is produced in Finland, and in the Black Forest, and other parts of Germany, but it has no connection, beyond the name, with Burgundy. It is used in medicine only as an ingredient in plasters, but in Germany it is employed with rosin for lining brewers' casks. It is very seldom found pure, and indeed the greater part of what is sold as B. P. has none of that particular resin in its composition.

Burgundy Wines. Under the name of Burgundies several well-known wines, both white and red, are derived from Central France. Of the red wines, the best-known brands are Chabertin, Clos Vougeôt, Volnay, Beaune, and Macon; the white brands include Chablis, Pouilly, Meursault, and Montrachet. Burgundy is a fuller-bodied, more generous wine than claret, but is said to encourage gout. It is of great service in cases of weakness and impoverished blood.

Burhanpur, a walled town of India, Central Province, district of Nimar, on the Tapti, and a station of the Bombay and Benares Railway, 280 miles N.E. of Bombay. It has manufactures of silks, muslins, and brocades. B. was formerly in the Gwalior territory, but was exchanged, along with the rest of Scindia's possessions S. of the river Nerbudda, for land on the Betwa river in 1861. Pop. (1872) 29,303.

Burial of the Dead. The disposal of the dead has always been accompanied by ceremonial observances indicative of

respect and reverence, though these have differed greatly among different races at different times. The primitive idea, of providing a habitation for the dead gave rise to the various forms of barrow-burial (see **BARROWS**), and its characteristic customs, the most prominent of which was the furnishing of the house of the dead with the implements, utensils, and ornaments of the present life. These burial customs were the natural offspring of the purely material conceptions of a future existence characteristic of Paganism, and were not confined to the ruder periods of prehistoric times. Semiramis buried her husband in the palace at Nineveh, and raised over him a vast mound of earth, which remained after the destruction of the city. The tombs of the Etruscans were splendidly furnished, and the dead lay on couches, surrounded with their arms and ornaments, and all the appliances of a luxurious life. Cremation, which commenced in the Stone Age, became characteristic of the higher civilisation of the Age of Bronze; but though it abolished the great stone chambers, as no longer congruous or necessary when the body had been reduced to a handful of ashes, it did not entirely abolish the custom of depositing with the dead the prized possessions of the present life. Cremation was practised by the most refined and polished nations of antiquity. Among the barbarous races of Northern Europe, in the later Iron Age, it was accompanied by the immolation of human victims. The high-caste Hindus still burn their dead, and *suttee*, or the sacrifice of widows on the funeral pile of their husbands, is only prevented by penal enactments. Both cremation and inhumation are practised in Japan, and the Shans of Northern Burmah bury the common dead, but burn their priests. Cremation, however, has always been a distinctively Pagan rite, and though a return to the ancient practice has been recently advocated on sanitary grounds, it has never been sanctioned by any section of the Christian Church. While tolerating many of the other burial customs of Paganism—as, for instance, the placing of ornaments and insignia in the grave, the burial of the corpse in robes of office, depositing with it pieces of money, vases of clay, and other objects of common use or ceremonial significance—the practice of cremation was always prohibited under the severest censures and penalties. Other methods of disposing of the dead, such as embalming, were practised indifferently by Pagans and Christians. Among the Egyptians this art was specially cultivated. It was practised in a modified form by the Jews, and there are traces of somewhat similar customs among the ancient Peruvians, whose cemeteries present many points of resemblance with the mummy-pits of Egypt. The modes of burial practised by savage tribes afford striking illustrations of the sepulchral customs of prehistoric times. The Esquimaux bury their dead under cairns, the corpse being placed in the contracted posture characteristic of all early burials, with the knees drawn up to the chin. The dead man's implements and weapons are placed beside him, and sometimes even his boat is buried with him. In Tahiti, again, in the period of their Paganism, the dead were laid on platforms in the open air, covered by a roof and protected by a fence. The weapons of the deceased were laid by his side, and a supply of food and drink placed for him. When the body had decayed, the bones were collected and placed in a pyramidal pile of stone-work erected as a monument. Some of these are suggestive of the enormous size of the monumental structures of the early Stone Age. One measured 267 feet in length, by 87 feet in breadth, and 44 feet in height, being regularly built in stages like a pyramid, and entirely without metal tools. The burial customs of Christian times, though marked at first by the survival of the less objectionable usages of Paganism, became subsequently distinguished by their severe simplicity and absence of ceremonial. In the first four centuries the Christians of Rome buried their dead in the catacombs, decorating their tombs with paintings and sculpture, and substituting scriptural subjects for those of the heathen mythology previously in use. In later times, when cemeteries were attached to the churches, burial in consecrated ground became the universal practice of Christendom.

Burial Regulations. In England, on representation of a Secretary of State, an Order in Council may, for the protection of the public health, prevent the opening of new burial-grounds in any city or town, or within other limits; or may order, wholly or partly, the discontinuance of burials in places specified in such

order. The order does not extend to the burial-grounds of Jews and Quakers, unless expressly included. On the petition of a borough council, the crown may, by order, give it power to provide burial-ground. On order, the borough council acquires the power vested in burial boards under 16 and 17 Vict., c. 134. Expenses are to be paid out of the borough funds or rates. Money may be borrowed at a lower rate of interest to pay off securities bearing a higher rate. There are special provisions for metropolitan burials and cemeteries.

Burial Societies are Benefit Societies (q. v.) constituted in the usual manner. Their object is to supply money for paying the funeral expenses of deceased members, or of any of their family. The system for a while led to fearful abuses. It was found that children, and even adults, were sometimes insured in more than one society, and then either killed or allowed to die of neglect. The stringent regulations made by Parliament for certifying cause of death before any insurance is allowed to be paid, have had a most beneficial effect in preventing these crimes.

Buridan, Jean, a scholastic of the 14th c., born at Béthune, in Artois. After studying under William of Occam, he taught philosophy at Paris University, of which he was rector in 1347. According to one account, he was murdered by command of Marguerite of Burgundy; according to another, he was driven to Austria because of his adherence to Nominalism. He is the reputed author of the sophism known as 'B.'s Ass,' which asserts that a hungry ass will starve if set between two equally attractive bundles of hay, as there is nothing to determine its choice of either. B.'s most important works are the *Summula Dialectica* (Par. 1487); *Compendium Logicae* (Ven. 1489; Oxf. 1637); *In Aristotelis Metaphysica* (1518).

Bur'in (Fr. *burin*), an almost obsolete name for the tool now called a graver, used by engravers in steel, copper, and silver. It is made of tempered steel, is of a diamond form, and has the graving end ground off obliquely to a sharp point. From the characteristic handling of the tool by picture engravers came the expressions *brilliant B.*, *soft B.*

Buriti Palm (*Mauritia vinifera*), a tall, graceful palm found in the swamps of the northern parts of Brazil and Guiana. It receives its specific name (*vinifera*, wine-bearing) from the juice, which is extracted from the stem, and used as a drinking beverage. The tree, however, has to be cut down in order to obtain this juice. An oily pulp surrounds the seeds, which is used as food, and as a preserve by preparing with sugar.

Burke, Edmund, one of the greatest orators and politicians, and, in the opinion of De Quincey, the 'supreme writer' of the 18th c., was born at Dublin, January 12, 1728 or 1729. His father was a solicitor, of good family, and a Protestant; his mother, whose maiden name was Noyle, was a Roman Catholic; his schoolmaster (Abraham Shackleton of Ballitore, Kildare) was a Quaker. B. was educated at Trinity College, Dublin, where he was a more than average student, and much given to miscellaneous reading. He then became a law student in London, but is described as being 'fond of literature, and anything but fond of law.' In 1756 B. came before the world as an author, his first work being *A Vindication of Natural Society*, a parody of Bolingbroke's arguments regarding society. His next work, an essay on the *Sublime and Beautiful*, although now considered shallow, established his reputation as a writer, and obtained him an entrance into that society of which Johnson, Garrick, and Reynolds were among the chief stars. In 1759 he became private secretary to Mr W. G. Hamilton, commonly known as 'Single-Speech Hamilton,' then Secretary for Ireland, accompanied him to Ireland, and is believed to have prompted the efforts of Government for relaxing the penal laws against Roman Catholics. In 1765, B. quarrelled with Hamilton, but became private secretary to the Premier, the Marquis of Rockingham, who continued his friend to the last. In 1766 he entered Parliament as member for Wendover. For nearly thirty years he sat in the House of Commons as member in turn for Wendover, Bristol, and Walton, obtaining the reputation of being the most conscientious of politicians, and the greatest, though not, at least latterly, the most popular of English orators. We can only give a few of the leading incidents in B.'s career. He

was a most strenuous advocate of a policy of conciliation with America, and he prepared the way for the abolition of the slave trade. In 1780 he brought forward a great scheme of economical reform, only a portion of which was adopted. In 1781 he sat on a committee of inquiry into Indian government, and he was chief promoter of the trial of Warren Hastings, which began in 1788, and did not end till 1796. He separated from the Whig party on the subject of the French Revolution, his opposition to which he has expressed in three of the best-known and most eloquent of his productions—*Reflections on the French Revolution* (1790), *An Appeal from the New to the Old Whigs* (1791), and *Letters on a Regicide Peace* (1796). He held twice the office of Paymaster of the Forces, first under Lord Rockingham, and next under Lord North. Finally he retired from Parliament in 1794, with the thanks of the House of Commons for his services, and pensions to the amount of £3700. Being attacked on account of these by the Duke of Bedford, he replied (1795) in one of his most spirited papers, entitled *Letter to a Noble Lord*. B., who was married in 1757, received in the death of his only son, a young man of great promise, a blow from which he never recovered, and he died at his residence of Beaconsfield, July 9, 1797.

In private life affectionate, benevolent, and virtuous; in public life, and during a period of corruption, a purist; having none of 'that master-vice, sloth, in his disposition,' B. is one of those men of whom Great Britain will always be wholeheartedly proud. There is much dispute as to his position as a man of letters and a political philosopher; Carlyle terms him 'a resplendent, far-sighted rhetorician, rather than a deep, sure thinker;' and it is undeniable that his imagination and strong passions led him into extravagances both of speech and of action. But it will always be admitted that he was a thoroughly sincere politician, anticipating in regard to many matters future generations; that, everything considered, he was the first orator of his time; and that in splendour of style he comes next to Milton as a writer of English prose. B.'s works have passed through many editions; the latest, which began in 1866, being that of the Clarendon Press. The best biography of him is that by Mr J. Macknight (1858-60). See also Morley's *Edmund Burke, a Historical Study* (Lond. 1869).

Burleigh, Lord. See CECIL.

Burlesque (Ital. *burla*, 'mirth, mockery'), the lowest of the three mirth-producing arts—comedy, farce, B.; it distorts and caricatures, and contrasts incongruities, without aiming at the final harmonising of them which is the soul of comedy, and should not be totally neglected in farce. Lucian is the greatest master of B. among the ancients. It was first made popular in modern times by Berni in Italy and Scarron in France. See Flögel's *Geschichte des Burlesken* (Leips. 1794).

Burlett's (dim. of Ital. *burla*, 'mirth, mockery'), a musical farce or comic opera.

Burlington, a city and port of entry in the state of Vermont, U.S., on the E. side of Lake Champlain. It has the best harbour on the lake, and is the largest town in the state. The city stands on a fine site, a high ground with the lake and its islands in the near view, and the Adirondack Mountains, 5000 feet high, in the distant W. It has daily steamboat communication in summer with Rouse's Point and White Hall, the opposite ends of the lake, and thence by rail with New York and Montreal. In 1874 its imports amounted to 7,225,042 dollars, and its exports to 3,733,148 dollars. The state university of Vermont, founded in 1791, is placed here, and the city has, besides, excellent schools and academies. B. contains the tomb of Ethan Allen, a famous Revolution hero. Pop. (1870) 14,387.

Burlington, a town in New Jersey, U.S., on the Delaware, between Philadelphia and Trenton, and about 20 miles above the former city, with which, as well as with New York, it is connected by railway. Pop. (1870) 7000.

Burlington. See BRIDLINGTON.

Burma, or **Ava**, an inland kingdom of Further India, between India and British B. on the W., China on the E., and British B. and the states of the Indo-Chinese peninsula on the S. Area, 170,000 sq. miles; pop. from three and a half to four millions.

The trend of the great rivers of the country, the Irrawaddy and the Salween, which flow from N. to S., sufficiently indicates the general slope of the surface. There are alpine regions on the northern frontier, near the sources of the Brahmapootra and the Mikong; but towards the S. the mountains give way to thickly-wooded hills and verdant fertile uplands, while near the southern frontier rich alluvial plains occur. 'The richness of these hills and mountains is only surpassed by the amazing fertility of the plains, nature seeming to have lavished her choicest gifts in every possible way and direction,' writes Captain Bowers, in his *Bhamo Expedition*. The climate is described as excellent throughout, though the forests are said to be dangerous from malaria. The temperature ranges from 50° to 70° Fahr., and is remarkably equable. Rice is the principal product, but maize and wheat are grown on the slopes and hillsides, and the tender tops of bamboo shoots, which taste like parsnips, form an important article of food. The plantain and mango are the favourite fruits. Tobacco and tea are grown. B. abounds in teak, pine, varnish wood, and other valuable timber-trees; while gold, silver, iron, and copper are believed to exist in great quantities. The tiger, leopard, tiger-cat, elephant, rhinoceros, buffalo, and Indian ox, haunt the forests and plains. The Burmese are muscular but not tall, and fond of athletic exercises. The four great races are the Môn, the Karen, the Burman, and the Tai or Shan. The Môn occupy the sea-coast and lower valleys of the great rivers. The Karens and wild tribes are scattered over the mountain-ranges. The Burmans (pure) occupy the upper Irrawaddy, Tavoy, and Mergui, while another sect (Mugs) occupy Arakan. The Shans are found on the borders of Siam. Besides these, there are numbers of Chinese and natives of Hindustan that have settled in the country since it became a British possession.

Religion, Education, Language, and Literature.—The religion of B. is Buddhism (q. v.), and, judging from the esteem in which the priests or monks are held, and by the innumerable monuments, monasteries, and temples in the country, and from the circumstance that the monks are the recognised and almost the only teachers of the youth of the land, this form of heathenism is a living and a considerable force among the Burmans. The latest incarnation of Buddha is worshipped under the name of Gautama, whose images and temples everywhere abound. The monks, called *pon-gyes*, live in monasteries, or *kyoungs*—are supposed to observe vows of chastity, poverty, and seclusion—and are supported exclusively by the contributions of the people, for which, however, they make a valuable return in educating all the children in the villages around their *kyoungs* in reading, writing, and arithmetic. The children are called into the monasteries in the morning, and are there instructed for several hours. A monk may be released from his vows, and resume the active duties of life at any time. Two languages and two alphabets are in use—the Burman and Pali. The former, belonging to the monosyllabic group, is the vernacular. It is without inflexion, and the characters are formed of circles, segments of circles, and combinations of these. A set of the Pali *Tripitaka* or Buddhist Scriptures, written on palm-leaves, and filling fifty boxes, was presented by Sir A. Phayre to the Library of the Indian Office in 1875. Burman literature embraces songs, religious romances, and chronological histories.

History.—The Burmese claim descent from the Sakya kings of Kapilawasta, from whom sprang Gautama, the latest Buddha, who is said to have been born in the 6th c. B.C. The first tangible fact in their history, however, is the establishment of their seat of government, in 1364, at Ava, which continued to be the capital for 369 years. In the middle of the 16th c., Europeans (Portuguese) first became acquainted with B., which at this time had risen to the zenith of its power, having conquered the Peguans, and all but subjugated Siam. After having been subject to the Burmese for about 250 years, the Peguans, in the beginning of the 18th c., rose in insurrection, abolished Burmese supremacy, and in 1752 captured Ava, and carried off its king captive to Pegu. Meantime, a hero had arisen to restore the fame of the Burmese arms, in the person of Aloung-Zaya, a man of obscure birth, who, after defeating the Peguans in several minor engagements, recaptured Ava in 1753. This patriot became King of B., and assumed the name of Aloung-Phya, which Europeans have corrupted into Alompra. His career, if brief, was brilliant. He drove the Peguans out of B., reconquered Pegu, and carried his victorious followers across

Siam to the walls of Bangkok. Alompra died in 1760, and was succeeded by his son, who in his turn was succeeded by his brother, Tshen-byo-yen, 'the King of the White Elephant,' during whose reign an immense Chinese army, sent to annex the country, was defeated. This king was succeeded by his son in 1776, who reigned five years, and was succeeded by Moun-Moung, grandson of Alompra, a mere puppet in the hands of his uncle, who supplanted him, and ascended the throne in 1781 under the name of Men-tara-gyee. This prince, in whom the active spirit of Alompra seemed to survive, annexed Arakan to the Burman empire. He died after a reign of thirty-eight years, during which he removed the capital to Amarapura, and was succeeded by his grandson, Phya-gyee-dau, in 1819. It was, during the reign of Men-tara-gyee war first broke out between the British and Burmese (see BRITISH BURMA), which resulted in the cession of Arakan and Tenasserim to the East India Company. Phya-gyee-dau removed the capital back to historic Ava in 1822. He was dethroned in 1837, and was succeeded by his brother Tharawadi; but he exhibiting symptoms of insanity, was put under restraint in 1845, and his eldest son, the Prince of Pagan, appointed regent. During his tyrannic regency the secret war between Britain and Burma, by which the British secured the rich provinces of Pegu and Martaban, took place. The tyrant was deposed, and another son of Tharawadi, Prince Mendon-Men, who ascended the throne in 1853, and died in 1878. Early in his reign he removed the court to Mandalay. In 1855, a British embassy was commissioned to the Burmese court, under Major, now Sir A. P. Phayre, to endeavour to arrange a commercial treaty on the basis of former arrangements; but the king, who had refused to sign a treaty recognising the British annexation of Pegu and Martaban, would not listen to the British ambassador. The attempt to arrange a commercial treaty was again made by Sir A. P. Phayre in 1862, with partial success. Meantime, however, the Burmese king, though unwilling to agree to a treaty of commerce, had become not only a trader, but a monopolist on his own account. This, which gave rise to much discontent among the Burman nobles, which was intensified by the impression that the court was more to be removed, to the loss of its large landholders. The outcome of this feeling was that five of the king's sons headed a rebellion to dethrone their father. Mendon suppressed the insurrection, after which one of his sons fled to the Shan States, while the other sought British protection in Bengal. After the rebellion had been crushed, Sir A. P. Phayre was sent the third time to Mandalay on the same purpose as before, but the king was so much elated by his triumph over the rebels to listen to any proposals from a foreign power. In the following year, however (1867), Colonel Fytche, on the part of the British Government, concluded a treaty with the Burmese king, whereby trade in B. was thrown open to British subjects, and a commercial court, to be presided over by the British political agent, for the decision of trade disputes, was to be established at Mandalay. This treaty, during the life of Mendon, remained a dead letter. The author of the *Land of the White Elephant*, writing in 1873, thus describes the commercial and other relations subsisting between the king and the so-called government of B.: 'At present there is a royal monopoly of the *paddy* (rice) and cotton, and other leading products—maize, amber, gold, copper, coal, and gems above a certain size (all over 100 rupees in value). The king will not leave his palace for fear of foul play, and has never seen his own war-canoes or steamers. There is no government in B., and bribery and corruption prevail in every department. The king sets the example. He appropriates most of the revenue; he buys goods from merchants, and, putting his own value upon them, serves them out as pay to his troops and servants, who, rushing with them to the market-place, find they can only obtain for them a fraction of the price at which the king had valued them.' Matters have not improved since the accession of Theebaw in September 1878. That monarch at first seemed disposed to follow prudent and enlightened counsels, but his political moderation was only a mask. A massacre (1879) of all his near kinsmen, under a half-maniacal terror of conspiracy, sent a thrill of horror through the East; and it is not difficult to predict what policy will be forced upon Britain should some radical change not take place in the character and habits of this drunken savage. See Yule, *Narrative of a Mission to the Court of Ava* (Lond. 1858); Marshall, *Four Years in B.* (2 vols. Lond. 1860);

Mason, *B., its People and Natural Productions* (Rang. 1862); Captain Bower, *Bhamo Expedition* (Rang. 1869); Vincent, *Land of the White Elephant* (1874); and Gordon, *B. and its Inhabitants* (Lond. 1876), and Fytche, *B., Past and Present* (Lond. 1878).

Burma, British, a province of British India under the government of a chief commissioner, is a maritime country on the W. side of the Indo-Chinese peninsula, washed on the W. by the great Bay of Bengal, and bounded on the E. by the dominions of Burma and Siam. It extends in lat. between 22° 40' N. and 10° S. Area, 88,556 sq. miles; pop. (1876) 3,010,662. It consists of three divisions—Arakan in the N., with four districts; Pegu, the central division, with five districts; and Tenasserim, in the S., with six districts. It extends for nearly one thousand miles along the shore of the Bay of Bengal, from the Naaf estuary, in about 20° 50' N., forming the boundary between Arakan and Chittagong to the Pakehan stream, which separates Tenasserim from Siam a little S. of 10° N.

Physical Aspect, &c.—The surface, which presents every variety of beautiful scenery, is mountainous in the N., and undulating or flat in the S. The country is traversed from N. to S. by rivers and streams having their sources in the Himalaya, and the chief of which are the Kuladan, Irrawaddy, Sittang, and Salween. The parallel valleys of these rivers are separated by hill-ranges, which attain considerable altitude in the N., but gradually diminish in height towards the S. Of the whole area, one-half, or about 45,000 sq. miles, is cultivable, but little more than one-twentieth part is yet cultivated. The rivers as they approach the sea form wide and exceedingly rich deltas; the uplands are fertile, while along the eastern boundaries are ranges of mountains rising in some localities to the region of pines and rhododendrons.

Climate, &c.—The climate, which is moist and somewhat depressing, is tempered along the coast by the sea-breezes, and only the forest tracts during the rainy season are hurtful to Europeans. The S.W. monsoon, which sets in in May, brings up a continuous stream of rain-clouds from the Pacific, which, striking on the hills of Arakan and Tenasserim, are condensed, and fall in ample rains during half the year. In the delta of Pegu the rains are plentiful, but not heavy, while in the N. of this division, which is sheltered from the S.W. monsoon by the Arakan hills, rains are scanty, and drought is sometimes felt. The thermometer ranges from 75° to 85° along the coast during the S.W. monsoon (from May to October); during April and May it sometimes rises to 100° in the shade, and in the northern part of Pegu it ranges to a maximum and minimum of ten degrees above and below what it registers on the coast. Cold weather prevails on the higher mountains, and frost is frequent there in winter. Among the natives epidemics are neither frequent nor fatal, but infant mortality between the ages of one and six is very high. The British regiments stationed at Rangoon and Maulmain near the coast, and at Thayetmyo and Toungoo on the northern frontier, enjoy excellent health during their four years' service.

Products, &c.—The soil is fertile, and the productions are at once various, valuable, and practically limitless in quantity. The staple products are rice, teak wood, and cutch; but excellent cotton, tea, coffee, sugar, tobacco, cinchona, and indigo are successfully cultivated, and among the native trees are the catechu, cocoa, areca palm, plantain, jack, mango, durian, and mangosteen. The *Fauna* include the elephant, rhinoceros, bison, hog, deer, buffalo, bear, otter, tiger, leopard, and monkey, and there are pheasants, peacocks, and other game in considerable variety. Coal and tin occur, and there are petroleum wells in the valley of the Irrawaddy.

Revenue, Trade, &c.—The progress which the country has made since it came under British rule is very remarkable. Take, for example, the following table of the revenue and expenditure in the years 1864, 1873, and 1876 respectively, with the imports and exports for the first two of these years:—

	1864.	1873.	1876.
Revenue,	£947,948	£1,302,834	£2,004,813
Expenditure, . . .	521,793	666,626	675,935
Imports,	565,519	1,753,345	...
Exports,	1,030,733	3,795,580	...

Of the customs on imports, amounting in all, in the year ending

March 1873, to £83,000, the customs on imported cotton twist, thread, and piece-goods amounted to £22,956; on spirits, £25,998; on silk piece-goods, £6058; and on wine, £3021. The customs on exports in the same year amounted to £359,752, of which £357,682 was received from the exports of rice alone. The export trade of B. B. may be said to consist substantially of exports of rice, cutch, and teak timber, while the imports consist mainly of British manufactured goods. The principal ports where this trade is carried on are Rangoon (q. v.), Akyab (q. v.), Bassein (q. v.), and Maulmain (q. v.), from which there are shipped annually, by upwards of thirty firms, about 850,000 tons of rice—one house alone (Bulloch Brothers & Co.) exporting nearly 200,000 tons. The chief articles sent from B. B. into Burma, by the rivers Irrawaddy and Sittang, are betel-nuts, cotton twist and yarn, crockery, dried fish and fish-paste, silk, cotton, and woollen piece-goods, rice, paddy, and salt; while among the articles imported by the same route the chief are teak timber, copper, raw cotton, cutch, dyes, earthen, lacquered, and hard ware, gold leaf, &c. In 1867-68 the value of this trade was over £2,500,000. Since that time it has increased, and it is capable of indefinite expansion, could the industry of the Western nations be brought into direct co-operation with the industry of the Chinese, by opening a trade route between the Upper Irrawaddy and the Yangtse. Measures are still (1879) in progress to effect this desirable object. The resources of B. B. are abundant, and though much money has been spent in the embankment scheme of the Irrawaddy (over £266,300 in all down to the close of 1875), the facility with which an increasing revenue can be here collected encourages the Indian Government in carrying out important public works. A railway is now (1879) constructed between the capital, Rangoon, and the frontier, which in a few years will doubtless be extended through Burma to China. The land-tax is light, but is rapidly becoming productive as the cultivable land is being taken up for agricultural purposes, and is supplemented by the capitation-tax peculiar to this province; while the rice duty is reported at present to fall wholly upon the producer, and thus to be equivalent to a further enhancement of the land-tax. The holders of the land are the actual cultivators, and the plots average about five acres. The province is governed by a chief commissioner, appointed by the Indian Government. It is defended by 5517 troops (2232 being British), commanded by 128 British officers.

History.—The East India Company made several attempts early in the 17th c. to establish trade with the King of Burma, and a letter from that monarch inviting trade was received by an English factor as early as 1619. From this time British intercourse with the Burmese assumed some importance, and English factories were established at Syriam, Prome, Ava, and Bhamo. The Burmese conquered Arakan in 1783, and thus found themselves on the frontier of British territory. In 1794 difficulties arose, and an embassy was sent to Ava under Captain M. Symes, who, among other concessions from the Burmese king, obtained permission for English merchants to go to whatever part of the Burman territory they chose, and to buy and sell in security. Disturbed relations on the Arakan frontier commenced in 1811, and ultimately led to the war of 1824. The Burmese invaded English territory, and war was declared 5th March 1824. The treaty of Yandaboo, which ratified peace between the powers, 24th February 1826, provides that the provinces of Arakan and Tenasserim, and the districts of Yey, Tavoy, and Mergui, be ceded to the British. Cruelties towards the British and Americans, and the indignities which the King of Burma continued to heap upon British representatives in the country, led to the declaration of the second war by the British Governor-General, 10th January 1852; and on the 20th December of the same year, Lord Dalhousie's proclamation, announcing the annexation of the provinces of Pegu and Martaban, was published at Rangoon. Sir A. P. Phayre negotiated a treaty with the Burmese Government in 1862, which was revised and confirmed in 1867 between Colonel Fytche and the Burmese king. In terms of this treaty, trade was thrown open to all British subjects, and a commercial court was established at Mandalay, presided over by the British political agent, to decide all commercial questions arising between British subjects. In 1868, Captain E. B. Sladen, British political agent, set out to explore the trade route between Bhamo and Yunnan, and throughout the whole of his outward journey and return was menaced by the agents of the Burmese king, Mendon-Men, who, however, pretended throughout to act in the most

friendly spirit. From that time the king continued for several years to act with the same duplicity, until the mission of Sir Douglas Forsyth to Mandalay secured for Britain the right to send through Burmese territory an armed force sufficient to protect any expedition to Western China for the purpose of surveying the trade route. But nothing was done during the reign of Mendon-Men, and since the accession of Theebaw (September 1878) the complications with the British Government have again become very grave. See Forbes, *B. B. and its People* (Lond. 1878).

Burman is the name of a family noted for a succession of eminent scholars. It belonged originally to Cologne. **Franz B.**, born 1628 at Leyden, whither his father had fled from France, became a Professor of Theology at Utrecht, where he died, 12th November 1679. His eldest son, **Pieter B.**, the most distinguished of all the Burmans, was born at Utrecht, 6th July 1668; studied there and at Leyden, and in 1696 was appointed Professor of History and Rhetoric in the university there, but exchanged this chair for that of Greek Literature and Politics. In 1715 he removed to Leyden as Professor of Rhetoric, and died there, 31st March 1741. His earliest work was *De Vectigalibus Populi Romani* (Utr. 1694; new ed. 1737). His *Phadri Fabula* (Amst. 1698; Leyd. 1717) was followed by editions of Horace (Utr. 1699), Petronius (Utr. 1709; Amst. 1743), Velleius Paterculus (Leyd. 1719 and 1744), Quintilian (Leyd. 1720), Justin (Leyd. 1722), Valerius Flaccus (Leyd. 1724), Georg. Buchanan (Leyd. 1725), Ovid (Amst. 1727), Poeta Minores (Leyd. 1731), Suetonius (Amst. 1736), his last publication being a quarto edition of Lucan (Leyd. 1740). B. was distinguished by erudition rather than by taste, was irascible and overbearing, and had fierce controversies with several of his learned contemporaries. His son, **Kaspar B.** (born 1696, died 1756), published some legal works. **Franz B.** (born 1671, died 1719) is the author of several theological works in the Dutch language. Of his four sons, two were noted for their science or scholarship. **Johann** (born 1706, died 1779), Professor of Botany at Amsterdam, and author of several works on that subject, and **Pieter** (born 1713, died 1778), who was eminent in philosophy, and who edited many of the Latin classics.

Burn, Richard, born in 1720, at Winton, in Westmoreland. He is known as the compiler of two useful law books, the *Justice of the Peace* and *Ecclesiastical Law*. After being educated at Oxford, he received the living of Orton, in his native county. He held it till his death in 1785.

Burnes, Sir Alexander, an eminent traveller and diplomatist, born at Montrose, 16th May 1805. At an early age he entered the Indian army, in which he eventually became a lieutenant-colonel. In 1832 he was sent on a mission to Central Asia, for which he was peculiarly qualified by his knowledge of Oriental languages. Travelling disguised as an Afghan, he passed through Peshawur and Cabul, Bokhara and Persia, and for his services received public thanks and honours both in India and England. In September 1839, B., now knighted, received the appointment of political agent at Cabul. On the morning of November 2, 1841, a few hours after he had congratulated Sir William Macnaghten, whom he was to succeed as Envoy, on the tranquillity in which he should leave the country, he was murdered, along with his brother, in a sudden insurrection. His *Travels into Bokhara*, and a narrative of his residence at Cabul, published after his death, are works of great interest.

Burnet, applied to two genera of plants, *Sanguisorba* and *Poterium* (natural order *Rosaceae*, subdivision *Sanguisorbeae*). *S. officinalis* (the Great B) is common in moist meadows, chiefly in mountainous districts, and found almost all over Europe and Russian Asia to the Arctic circle. It is not recorded from Ireland. The root is astringent, and was formerly used in medicine. In Germany the plant is cultivated for feeding cattle. *P. Sanguisorba* (the salad, common, or garden B.) is found in dry pastures and clefts of limestone rocks in central and southern Europe and temperate Russian Asia, extending into southern Sweden. It is generally spread over the limestone districts of England and Ireland, but is scarce in Scotland. The leaves are slightly astringent, but are used in soups and salads.

Burnet, Gilbert, Bishop of Salisbury, an indefatigable historian and keen politician, was born at Edinburgh, 18th Septem-

her 1643. He belonged to an old Aberdeenshire family, and was educated at Marischal College, Aberdeen, where he applied himself with great zeal to study, particularly the study of theology. After travelling in England and on the Continent, he returned to Scotland, held the living of Saltoun for a few years, and in 1669, at the age of twenty-six, was appointed to the Professorship of Divinity in the University of Glasgow. Actively opposing the policy of Sharpe and Lauderdale, B. found it advisable to resign his chair in 1674, and removed to London, where he acquired a considerable reputation both as a preacher and as a politician. He narrowly escaped being involved in the Ryehouse Plot, and conducted the defence and attended the execution of Lord William Russell. On the accession of James II. he retired to the Continent. He became the trusted friend of William of Orange, accompanied him to England as chaplain, and was made Bishop of Salisbury. He continued a great favourite with the King, and in 1698 was appointed preceptor to the Duke of Gloucester, son of the Princess (afterwards Queen) Anne. His life was not without troubles. His first pastoral letter as bishop was burnt by order of both Houses of Parliament, because in it he founded the right of William to the throne on conquest; and an exposition by him of the Thirty-nine Articles was declared to be heterodox by the House of Lords. He died, 17th March 1715, of pleuritic fever, in his seventy-second year. B., who was thrice married, was a hearty, genial, strictly virtuous and religious, and in spite of certain passionate outbursts essentially prudent Scotchman. He wrote many works of history and biography, of which the most valuable are his *History of the Reformation*, the first volume of which appeared in 1679, and his posthumous *History of My Own Time, from the Restoration of King Charles II. to the Conclusion of the Treaty of Peace at Utrecht in the Reign of Queen Anne*. His style is not very elegant, and sometimes dry, but it is vigorous and never extravagant, and he has an almost Boswellian power of massing details of fact and even of gossip, and thus of producing accurate historical portraits. Macaulay, in his *History of England*, vindicates and extols B., who was unfairly ridiculed by the wits of his time.

Burnet, John, a Scotch painter and engraver of considerable merit, was born at Fishersrow, near Edinburgh, March 1784. He is the author of several works on painters and painting, of which *Rembrandt and his Works* (1849), and a *Practical Treatise on Painting*, are the chief, but he is best known for his admirably-executed engravings of the works of Wilkie.

Burnet, Thomas, philosopher and divine, was born at Creft, in Yorkshire, in 1635. He was educated at Cambridge, and, after acting as travelling tutor to the sons of several noblemen, became, in 1685, Master of the Charterhouse—where he distinguished himself chiefly by opposing the arrogation of the dispensing power by James II.—and subsequently clerk to the closet and chaplain to King William. From this latter post he was compelled to retire by the publication of his views on the Mosaic account of the Fall. B. died 27th September 1715. His *Telluris Theoria Sacra* (published in Latin in 1680, in English in 1691) is the work with which his name will be permanently associated. It is an ingenious but extravagant speculation, full of eloquent passages—those on the Flood and the final burning of the earth being especially admired.

Burnett Prizes, The. were founded by Mr. B., of Dens, Aberdeenshire, who was born in 1729, and after a prosperous career as a merchant in Aberdeen, died in 1784. He left his fortune partly for charitable purposes and partly for these prizes. The prize fund was to accumulate for forty years at a time, and two prizes, not less than £1200 and £400, were to be offered for the two best essays on 'The evidence that there is a Being all-powerful, wise, and good,' and to 'obviate difficulties regarding the wisdom and goodness of the Deity, without reference to revelation.' The competition is open to the world, and the judges are three persons appointed by the trustees of the testator, together with the ministers of the Established Church in Aberdeen, and the Principal and Professors of Aberdeen University. In 1815, at the first competition, fifty essays were sent in. Dr W. Lawrence Brown, Principal of Marischal College, Aberdeen, gained the first prize of £1200 for an essay on the *Existence of a Supreme Creator*. The second prize of £400 was awarded to the Rev. John Bird Sumner, afterwards Archbishop of Canter-

bury, for an essay on the *Records of Creation*. The second competition took place in 1855, when the formidable number of 208 essays were presented. The judges were the Rev. Baden Powell, Mr Henry Rogers, and Mr Isaac Taylor. The first prize of £1800 was won by the Rev. Robert Anchor Thompson, Lincolnshire, whose essay was entitled *Christian Theism*; the second prize of £600, by the Rev. John Tulloch, Principal of St Mary's College, St Andrews, whose essay was entitled *Theism*. All these essays were published. It is said that £10,000 will be available in 1895.

Burnett's Disinfecting Fluid, a liquid antiseptic and deodoriser, prepared from zinc chloride, and introduced by Sir William Burnett. It acts on sewage and other decomposing animal matter by decomposing the ammonium sulphide which evolves the offensive gas, and forming ammonium chloride and zinc sulphide, both of which are odourless and innocuous. B.'s F. is not now in much use, as other antiseptics and deodorisers have taken its place.

Burney, Dr Charles, an eminent musical composer, was born at Shrewsbury, 1726, studied music under Dr Arne, and worked as a music-teacher and composer in London and elsewhere. He became organist to Chelsea Hospital in 1789, and died 15th April 1814. B.'s compositions are not now heard of, but his memory lives in connection with his *General History of Music from the Earliest Ages to the Present Period*, upon which he spent great labour, and which long remained the standard work upon its own subject. B. also wrote a *Life of Handel*, and several other works.

Burning Glasses and Mirrors. See LENS and MIRROR.

Burnley, a town in the E. of Lancashire, on the Burn, a branch of the Calder, 24 miles N. of Manchester, and a station on the London and North-Western Railway, also connected by a branch from Todmorden with the Yorkshire and Lancashire railways. It has woollen and cotton factories, calico-printing works, iron and brass foundries, machine-making works, breweries, tanneries, and rope-works. There is a plentiful supply of water, and coal is abundant in the neighbourhood. A Roman road passed through B., and numerous Roman relics have been found in the vicinity. Pop. (1871) 40,858.

Burnouf, Eugene, a noted French Orientalist, was born at Paris, 12th August 1801. He devoted himself to the study of Eastern languages, and produced in 1826 an *Essai sur le Pali*. B.'s high place among Oriental scholars, however, was gained by his rediscovering the meaning of the Zend, or ancient Persian language, the key to which had been lost. Certain MSS. in that tongue, brought to Paris by Anquetil Duperron, lay in the *Bibliothèque Royale*, and these B. deciphered by intense labour and a fine critical acumen. In 1830 he began by publishing the Zend text of the *Vendidad-Sadé* of Zoroaster, accompanied by a Sanskrit glossary, and in the *Journal Asiatique* he afterwards gave to the world the fruits of his invaluable investigations. In 1834 appeared the first volume of the *Commentaires sur le Yagna, l'un des Livres Liturgiques des Perses*. This work illustrated the language, no less than the tenets, of Zoroaster. B.'s knowledge of Sanskrit was shown by his edition of the *Bhagavata-Purana*, or *Histoire Poétique de Krichna*, and he wrote also on cuneiform inscriptions. His *Introduction à l'Histoire du Bouddhisme* appeared in 1845. The materials for this great work were furnished by an Englishman, Mr Brian Hodgson. In it B. explains the dogmas and the origin of Buddhism. It is still the greatest work on the subject. (See BUDDHISM.) He died 28th May 1852, in the prime of life, having won a world-wide reputation.

Burns, Rev. Jabez, D.D., a noted Baptist preacher and author, was born in 1805, at Oldham, near Manchester. He removed to London in 1826, where he began to preach in 1835, and soon acquired and retained a great celebrity in his denomination. B. died 1st February 1876. He was a prolific writer. Among his works may be mentioned *Sketches and Skeletons of Sermons*, *Christian Philosophy*, *Deathbed Triumphs*, *Missionary Enterprises*, and *Christian Exercises for every Lord's Day in the Year*.

Burns, Robert, was born January 25, 1759, in a cottage near Ayr. From his father, who, although originally only a nursery-

gardener, and never rising beyond the position of a small farmer, was a man of strong intelligence as well as sterling worth, he obtained an education considerably above that of the ordinary peasant's son, and which was sufficient to open to him the gates of miscellaneous reading. He read poetry greedily, and began to compose verses in the Scotch dialect at an early age. These attracted notice in the district in which he lived, and gained him many friends, some of whom, by the convivial excesses to which they allured him, did him more harm than good, and he fell in more ways than one from the path of rectitude in which he had been trained to walk by his father. A farming venture which he tried in 1781, with his brother Gilbert, at Mossiel, near Mauchline, failed; he became embittered and embarrassed by the results of a *liaison*, which seems, however, to have been in reality a Scotch marriage, with Jean Armour, the 'Bonny Jean' of his poetry; and he was on the point of emigrating to Jamaica, when the favourable reception accorded to a collection of his poems, which he had published (1786) in Kilmarnock to defray the expenses of his passage, induced him to remain in this country, and he went to Edinburgh to superintend a new edition of his poems. For a brief period he was the lion of fashionable and literary society there, and astonished all who met him by the vigour of his intellect and the brilliancy of his conversation. Realising a considerable sum from the new edition of his works, he once more took a farm (in 1788) at Ellisland, near Dumfries, and settled there with Jean Armour, whom he had now publicly married. He united to the farm the office of exciseman, and when the former failed him, he removed to the town of Dumfries as an officer of excise on a salary of £50, which never rose above £70; and at no time did B.'s income, including perquisites, exceed £90. His ardent, liberty-loving spirit caught fire at the time of the French Revolution, and some indiscreet speeches and actions, which were construed as evidence of his holding Jacobinical opinions, being reported to the Board of Excise, he seems to have been verbally threatened with dismissal, and his promotion to have been delayed. Recent investigations, however, show that no censure was ever recorded against him in the books of the Excise Board, and that, had he lived a few months longer than he did, he would have been promoted to a superintendency, which would have doubled his income. B. was, however, shunned by the 'better' classes in Dumfries, chiefly on account of his supposed opinions. There can be no doubt that his proud and sensitive soul was deeply wounded. He gave way now and then to a constitutional melancholy; and although he always attended regularly to his duties, and never became in any sense whatever a drunkard, he injured his health by imprudent excesses. Broken in health and in spirits, but with his muse active to the last, the great poet died in Dumfries, July 21, 1796.

The greatest of Scottish poets, B. is distinguished by variety as well as by intensity of power, and unites the most blithe, brilliant, and wanton humour with the noblest fervour and the softest pathos. He is not a rough, careless versifier. When using the Scottish dialect he displays an almost Shakespearian felicity of language. As a popular lyricist he is unrivalled; compared to him even Beranger rings somewhat thin and unsatisfying. His songs, burning and trembling with the sincerest passion—free both from crudeness and from the weakness of elaboration—move to faultless music, and breathe and bloom with the freshest and loveliest imagery. On Scotchmen, at least, they bestow a pleasure at once stronger and sweeter than can be derived from any other author in the wide realm of literature.

B.'s works have passed through innumerable editions in Britain, the Colonies, and America, the best-known being those of Currie, Allan Cunningham, R. Chambers, and Elately Waddell. M'Kie (Kilmarnock) has published a *facsimile* of the first, or 1786 edition, and, under the title of *Burnsiana*, a singularly complete account of the extensive literature to which the poems of B. have given birth. In 1859 the centenary of his birth was celebrated all over the world with great enthusiasm; and there is scarcely a community of Scotsmen in the world that has not its 'B. Club,' which, on the 25th of January every year, toasts the 'immortal memory' of the poet in orations which are fast becoming a public nuisance.

Burns and Scalds are injuries produced by heat to the tissues of the body. When by a solid, it is called a burn, and by

a fluid, a scald. The danger due to B. or S. varies with the amount of surface injured, the depth to which the burn or scald has penetrated, the importance of the part affected, and the age and constitution of the patient. B. and S. are very dangerous in very young or very old people. Inflammation of internal organs is a serious consequence of many B. and S. The symptoms vary with the degree of injury. The chief are shock, sometimes fatal; rapid and weak pulse, and often severe pain. *Treatment.*—When exhaustion and faintness come on, give brandy and other stimulants; when there is great pain, opium will often give relief; and in very bad cases the patient may with great advantage be put under the influence of chloroform till the wounds are dressed, or even for some days he may be kept under the influence of chloroform if necessary. *Local treatment* consists in excluding the air. This may be accomplished sometimes by immersing a limb in cold water. Ice to the part often does good. Carron-oil, which consists of equal quantities of olive-oil and lime-water well shaken together, forms a most soothing application. It receives its name from the Carron Ironworks, near Falkirk, where it is extensively used by those who work amongst molten metal. After the application of Carron-oil, the part is to be covered with cotton-wadding, and a gentle bandage is to be applied. The patient should be kept in as easy position as possible. When a blister forms, it is to be pricked, but the loose skin is not to be removed. Care must be taken to prevent deformity by the contraction of the parts, so common during the healing of B. and S.

Burntisland, a seaport and summer watering-place in Fife-shire, on the Firth of Forth, 8 miles N. of Edinburgh. As a station of the Edinburgh, Perth, and Dundee Railway, it is connected by a steamboat ferry with Granton on the S. side of the Firth. There is a harbour, which is (1876) being much enlarged and improved; the trade is chiefly coal and iron shipping and distilling. B. unites with Kinghorn, Dysart, and Kirkcaldy to send a member to Parliament. It is an old place, originally under the Abbots of Dunfermline, and was made a royal burgh in 1568. Pop. (1871) 3422.

Burnt-Off'ering, one of the forms—indeed, the chief form—in which the ancient sacrifices were made. (See SACRIFICE.) Flame and smoke, in which the offering was consumed, was the means by which the sacrifice was conveyed to the deity, or the offering wafted to heaven. The sacrifice known specially as the B.-O. in the Mosaic law (Lev. i.) consisted of the slaying of a male victim, which was entirely consumed by fire, and was intended to make atonement for sins in general.

Burnt Sienna's, a fine chestnut-brown pigment obtained by burning an ochreous mineral called *Terra di Sienna*, and very useful in oil or water-colour painting.

Burnt Stones, a name given to ancient imitations of the sardonius, made by burning carnelians or sards with a red-hot iron plate, thereby imparting a white opacity to a thin layer of the translucent gems. They were highly valued among the Romans for gem-cutting.

Burnt Umber, a reddish-brown pigment prepared by burning an earthy ore of iron and manganese, first obtained at Umbria, in Italy. It is permanent, and mixes well with other pigments.

Burr, Aaron, third Vice-President of the United States, was born at Newark, New Jersey, February 6, 1756. He was a grandson of Jonathan Edwards. After studying at Princeton, he entered the Revolutionary army, but siding with the faction opposed to Washington, he was compelled to leave headquarters. In 1782 he began the practice of law in Albany, was made Attorney-General of New York in 1789, and United States senator in 1791. B. now became a leader of the Democratic party, and was made Vice-President, 1801, Jefferson being President. A bitter contest for the governorship of New York, in which he was defeated, led to the notorious duel with Alexander Hamilton (July 11, 1804), in which the latter was mortally wounded. B. next entered into a reckless scheme for the establishment of an empire in the S.W., including Mexico. He was apprehended, and tried for treason in Richmond in 1807, and though acquitted, never regained his former influence. He died at Staten Island, September 14, 1836.

Burria'na, a town of Spain, province of Castellon, on the Rio Seco, 8 miles S. of Castellon. It has exports of wine and fruit. Pop. 6200.

Burri'saul, a town of India, province of Bengal, executive district of Backerganj, on the Gangetic delta, 120 miles W. of Calcutta. Pop. (1871) 7684.

Burr'tt, Elihu, popularly known as the 'Learned Blacksmith,' was born in New Britain, Connecticut, U.S., December 8, 1811. He was the son of a shoemaker, and after receiving a common school education, was at the age of sixteen apprenticed to a blacksmith. Subsequently he removed to the town of Worcester, Massachusetts, and studied a great variety of ancient and modern languages while working at his trade. In 1844 he became an editor of a paper, and in 1846 came to England, where his fame as a linguist secured him much attention. B. returned to America in 1853, and took much interest in moral reforms and popular improvements, such as anti-slavery, temperance, peace, and cheap postage. B.'s works, of which the best known are *Sparks from the Anvil* and *A Voice from the Forge*, are not equal to his reputation. During his later years he lived in New Britain, teaching Sanskrit. He died 7th March 1879.

Burr'um, a town of India, N.W. Province, executive district of Boolundshuhur, about 40 miles N.W. of Delhi. Pop. (1871) 15,284.

Bursary (Lat. *bursa*, Fr. *bourse*, Ital. *borsa*, Eng. *purse*, from the Gr. *byrsa*, a hide, purses being usually made of leather), a word that arose with the institution of universities in the second half of the middle ages, and meant the money applied to the gratuitous boarding, lodging, and educating of poor students in common, under the supervision of the Principal and teachers of the university. The term is not used in the English universities, but the treasurers of colleges and halls are called bursars. Each of the four Scottish universities has numerous bursaries, which are generally the proceeds of capital and mortified sums, or of landed or other property bequeathed to furnish stipends for deserving students. There are presentation bursaries, but the rule is, since 1831, to award them by competition. They are for the most part of small value, but they have done much to promote the higher education in Scotland. The University Commissioners of 1863 recommended that several of the smaller bursaries should be consolidated into one, and otherwise gave valuable practical suggestions as to the mode of bestowing them, which have been to a great degree carried out. In St Andrew's, the number of bursaries attached to the United College is 81, varying in value from £5 to £50; the number belonging to St Mary's College (theological) is 20, in value from £6 to £50 per annum. The United College possesses 5 scholarships—2 of £50, tenable for four years; 2 of £50, tenable for two years; and 1 tenable for four years, value for the first year £100, and £50 for each of the three following years. The proceeds annually available for bursaries, prizes, and scholarships average about £2000. In Glasgow, the income of trust funds for scholarships, bursaries, and prizes from all sources, including the estate managed by Balliol College, Oxford, for the Snell Exhibitions, amounts to £6175, 15s. 11d. The bursaries, about 142 in number, range in value from £5 to £100, and the average value is fully £21. The Snell Exhibitions to Balliol College are 14 in number, of the value of £110, and tenable for five years. There are about 20 other scholarships or fellowships, in value from £30 to £200—4 founded in 1872 by George A. Clark of Paisley amounting to £200 each. In Aberdeen there are 250 bursaries, of which 223 are attached to the Faculty of Arts, and 27 to that of Theology. They vary from £5 to £50, and average fully £17 each, the total sum divisible being £4390, 6s. There are also 11 scholarships, of from £65 to £70 per annum, and several exhibitions to Cambridge. Edinburgh has 111 bursaries in the Faculty of Arts, 30 in Theology, 9 in Law, and 12 in Medicine—in all, 162. It has 37 scholarships in the Arts, and 8 fellowships—the Swiney Lectureship in Geology being reckoned one of these. The Ferguson scholarships, and the Scottish University classical scholarships, are open for competition to the graduates of the four universities. Bursaries are generally tenable for four years, the period embraced in the Arts course. Considerable diversity of opinion exists as to the utility of bursaries. They are said to act as temptations to unsuitable persons to devote themselves to a learned profession; on the other hand, they have often furnished

the supplement necessary to enable deserving youths to procure for themselves an otherwise unattainable education. The number of bursaries is being continually increased. The term B. survives in Germany under the form *Bursch*, which means either an apprentice bound to any trade, or (what is more familiar to our ears) a university student; but all idea of stipend has been eliminated from the word.

Bur'slem, a town in the N. of Staffordshire, and a station on the North Staffordshire Railway system, about 17 miles N. of Stafford. It lies on the Grand Trunk Canal, connecting the Trent and the Mersey, and now forms part of the parliamentary borough of Stoke-on-Trent. B. has long been famous for its earthenware. It is called the 'Mother of the Potteries,' and produces in great perfection porcelain, parian, white and black ware, lustre, encaustic tiles, &c. B. is supplied with excellent water by the Staffordshire Potteries Waterworks Company. A new town-hall was built (1865), containing lecture-rooms and news rooms, and a new covered vegetable market (1878) at a cost of £25,000; the Wedgwood Memorial Institute supplies a school of art, a free library, and a museum. Josiah Wedgwood, the great improver of pottery manufacture in last century, was a native of B. The town is very old, and appears in *Domesday Book* as *Burcardeslham*. Pop. (1871) 25,562.

Bur'ton, John Hill, LL.D., a well-known Scottish historian, was born at Aberdeen, August 22, 1809. Having graduated at Marischal College, he came to Edinburgh, and passed at the Scottish bar in 1831. For many years he was a regular contributor to the *Westminster and Edinburgh Reviews*, and to *Blackwood's Magazine*. In the department of law and political economy, he has written a work on *Political and Social Economy* (1849), *Narratives from Criminal Trials in Scotland*, *Manual of Scottish Law*, and a *Treatise on the Scottish Bankruptcy Law*. He was also co-editor with Sir John Bowring of the works of Bentham, and he prepared a volume of extracts from these works, issued under the title *Benthamiana*. Among the lighter productions of his pen are *The Scot Abroad*, *The Book-Hunter*, and the *Cairngorm Mountain* (1864). B. has also published *The Life and Correspondence of David Hume* (1846), *Lives of Simon Lord Lovat, and Duncan Forbes of Culloiden* (1847), and a *History of Scotland from the Revolution to the Extinction of the last Jacobite Rebellion* (1853). His magnum opus, however, is his *History of Scotland from the Earliest Period to the Revolution of 1688*, which at once took its place as the standard work on the subject. In 1854, B. was appointed Secretary to the Prison Board of Scotland by Lord Aberdeen's Government.

Bur'ton, Richard Francis, traveller and author, is the son of Lieut.-Colonel J. N. B., of Tuam, Galway, and was born in 1821. Entering the Indian army in 1842, he served under Sir Charles J. Napier, and became a captain in 1857. B. is chiefly famous for his daring as a traveller. He endeavoured to explore Arabia in the guise of an Afghan pilgrim, and nothing could be more remarkable than his adventures, as described in the account of them published (1855) under the title of *Personal Narrative of a Pilgrimage to El Medinah and Meccah*. Along with Lieutenant Speke, he penetrated into the region of the Upper Nile, in Africa, and discovered and explored the great Lake Tanganyika, for which he was rewarded with the medal of the Royal Geographical Society. Since then, B. has visited North America, the Mormon country, and Iceland, has been consul at Fernando Po, visiting the Cameroon Mountains and the King of Dahomey, at Santos in Brazil, and finally at Trieste, where he succeeded the late Mr Charles Lever. B., who is understood to be a most accomplished swordsman, shot, hunter, and linguist, has published books descriptive of his various travels and adventures. Among the chief may be mentioned *The Lake Regions of Central Africa* (1860); *The City of the Saints* (1861); *Abokuta, or the Cameroon Mountains* (1863); *Zanzibar, City, Island, and Coast* (1872); *Ultima Thule, A Summer in Iceland* (Lond. 1875), and *Two Trips to Gorilla Country* (Lond. 1876).

Bur'ton, Robert, author of *The Anatomy of Melancholy*, was born at Lindley, in Leicestershire, 8th February 1576, and studied at Oxford. He became vicar of St Thomas, Oxford (1616), and rector of Seagrave, Leicestershire, but resided chiefly at Christ Church. His famous book, 'by Democritus Junior,' appeared in 1621, and for some time enjoyed a popularity which declined after the author's death, to be revived in our own time.

During the period of its obscurity, it was freely laid under contribution by plagiarists; among numerous others, by Sterne. The work was composed that the author might be able to drive away melancholy by busy occupation. It is a marvellous repository of quotations, drawn from obscure authors, composed in a rough style, displaying much curious learning, and lighted up at times by quaint and humorous turns of thought and expression. B. died 25th January 1639. The Roxburghe Club published his *Philosophaster* and *Poemata* in 1862. B. had an elder brother, William (born 1575, died 1645), who obtained a reputation as an antiquary. His chief work is a *Description of Leicestershire* (1622).

Burton upon Trent, a town of Staffordshire, on the Trent, and a station on the Midland Railway, 24 miles N.E. of Stafford. A bridge of thirty-two arches across the Trent at B. replaced in 1864 one of thirty-six arches which was said to have stood since before the Norman conquest. Brewing ale is the staple trade. It began about the year 1700, and has now attained an enormous development. There are upwards of twenty breweries, but those of Bass and Allsopp are among the largest in the world. There are also large cooperages and some iron foundries. A fine church costing £36,000 was erected here by Mr. T. Bass (1874), and a new post office built (1877) at a cost of £7000. Pop. (1871) 20,378.

Burtscheid, a town of Rhenish Prussia, close by Aix-la-Chapelle, celebrated for its sulphurous springs (temp. 106°-155° F.). It has also ten cloth factories, engaging 1900 hands, and was formerly the seat of an abbey founded in 737 A.D. Pop. (1871) 10,081.

Buru, one of the Molucca Islands, lying E. of Celebes. Its greatest length from N. to S. is 50 miles, from E. to W. 90 miles; its area is estimated at 2500 sq. miles, and its pop. at nearly 20,000. The country is mountainous but fertile, producing, among other produce characteristic of these regions, cajuput oil, rice, sago, dyes, and aromatic woods. On the N.E. coast is the fine sheltered Cajeli Bay, on the S. shore of which lies the Dutch station, Fort Defence.

Burujird, or **Burujard**, a town of Persia, province of Irak-Ajemi, 190 miles N.W. of Ispahan. The plain on which it stands yields such excellent pasturage that there are always some Persian cavalry stationed here. B. has manufactures of carpets, and a trade in dried fruits and treacle of grapes. Pop. about 12,000.

Bur'wha, a walled town of Bornu, Central Africa, on the west shore of Lake Tchad, 80 miles N.N.W. of Kuka. The sole article of commerce is fish, which also forms the chief food. Pop. about 6000.

Bury, a manufacturing town of Lancashire, on the Irwell and Roche, 9 miles N.W. of Manchester, and a station on the Lancashire and Yorkshire Railway. It was at first a seat of the woollen manufacture, introduced here in the reign of Edward III. by Flemish weavers, and this is still largely carried on. But its great staple now is cotton-spinning. There are also extensive printing, bleaching, and dye works, paper-mills, and some iron foundries. The district abounds with coal-mines and freestone quarries. An ample supply of water has recently been brought into B., and an infirmary was erected (1874) at a cost of £6800. Pop. (1871) 41,344. The late Sir Robert Peel was born here, and there is a bronze statue of him in the old market-place. North of the town lies Chamber Hall, the property of the Peels.

Burying Bee (*Necrophorus*), a genus of *Coloptera*, belonging to the section *Pentamera*, and to the family *Silphidae*. The antennæ are short and club-shaped. These beetles derive their familiar name from their habit of burying dead animals or pieces of carrion in the earth, to afford a store of food for their larvæ. In some cases several beetles may thus unite to cover or bury animals (such as mice and small birds) many times exceeding their own size. These beetles occur in Britain, the *N. Vespillo* being the best-known native form, whilst other species inhabit N. America and elsewhere. The *N. Vespillo* averages an inch in length, and is marked across the back by two orange bands. It exhales a persistent and fetid odour. These beetles excavate the earth around their prey by means of their head, assisted by

the feet. The larvæ, produced from eggs deposited within the carrion, possess six feet, and are whitish grubs with brown heads. Another species, resembling the *B. B.* in habits, is the four-spotted carrion beetle (*Silpha quadripunctata*).

Bury St. Edmunds, a parliamentary borough and market-town in Suffolk, on the Upper Larke, 26 miles N.W. of Ipswich, and a station on the Great Eastern and Eastern Union Railway. It has no manufactures, but a trade in corn, cheese, butter, and wool. By an excellent system of drainage, the sewage is conveyed to a distance, and there it is raised by pumps to irrigate the land. In 1862, a new corn-exchange was erected, and the Suffolk General Hospital was rebuilt in 1864. The borough has returned two members to Parliament since the time of James I. Pop. (1871) 14,928. B. is a place of very great antiquity. Relics of the Roman period are abundant. Roman bricks and tiles were used in the building of its famous abbey. In earliest English times it was called *Beodricsworth* ('Beodric's house'), but received its present name in honour of the East Anglian under-king Eadmund, who was murdered by the Danes in 870, and whose ashes were interred here in 903. King Ælhelstan erected a church to his memory in 925. On the site of his tomb a monastery was founded by six priests, and connected with it Canute raised a magnificent abbey, only surpassed in privilege by that of Glastonbury. The abbot was mired, and sat in Parliament; he had the power of inflicting capital punishment, and the privilege of coining. The worries that the abbots of B. had in old times with obdurate burgesses are picturesquely sketched in Carlyle's *Past and Present*. The grammar-school of B. was founded by Edward VI. in 1550, and is free to the sons of inhabitants. It was at B. that the barons assembled (1214) and swore to defend the laws and liberties of England. Parliaments were held here in 1272, 1296, 1446, and sovereigns were often royally entertained in the abbey.

Busa'co, a mountain ridge in the province of Beira, Portugal, an off-set from the Serra de Alcoba, about 20 miles N.N.E. of Coimbra. On its summit is a convent, near which, on September 27, 1810, Wellington repulsed the French under Massena, who had attempted to force his position, and continued his retreat to the lines of Torres Vedras.

Busaquin'o, a town in the province of Palermo, Sicily, 29 miles S.S.W. of the city of Palermo, has linen manufactures. Pop. 8100.

Bus'by, Richard, D.D., a schoolmaster whose merits cannot possibly have excelled his fame, was born at Luton, Northamptonshire, September 22, 1606, educated at Westminster School, and Christ Church, Oxford, and head-master of Westminster from 1640 till his death, 6th April 1695. He saw sixteen of his old pupils raised to the bench of bishops. His success was due to his learning, zeal, and rigorous application of the rod, which he used to call his 'sieve,' as 'whoever did not pass through it was no boy for him.'

Bus'ca, a town of Piedmont, on the Maira, a tributary of the Po, 9 miles N.N.W. of Coni. The neighbourhood produces good wines. Pop. 9375.

Busch'ing, Anton Friedrich, one of the first geographers who supplied statistical information regarding the countries he described, was born at Stadthagen, in Schaumburg Lippe, September 27, 1724. He was appointed Extraordinary Professor of Philosophy at Göttingen in 1754, the year in which the first volume of his great work *Erdbeschreibung* was published at Hamburg. In 1761, B. accepted an invitation to St Petersburg as a Protestant preacher, but returning to Germany in 1765, he was appointed Director of the Gymnasium of the *Grauen Kloster*, in Berlin, the following year, where he died, May 28, 1793. B.'s *Erdbeschreibung* extended to 11 vols., and was not completed till 1792.

Bu'senbaum, Hermann, a Jesuit theologian, born in 1600, at Nottelen, Westphalia, and died 31st January 1668. His *Medulla Theologie Moralís* (Münster, 1645), a standard authority with his order, has passed through more than fifty editions. An enlarged edition, with commentaries, by P. Lacroix and Collendall, appeared in 1707. It was republished at Lyon in 1729, with further additions by P. Montausan, and again at Rome in 1757, by the Jesuit, Alfonso de Ligorio. It was

condemned by the Parliaments of Paris and Toulouse, as it was discovered that it declared regicide to be lawful. A defence of B., by P. Zacharia, was publicly burned, 10th March 1758. A new defence, by P. Angelo Franzoja, appeared at Bologna, 1760.

Bush Antelope, or **Bush Buck** (*Antelope* or *Cephalophus ruficollis*), the name of a solitary species of antelope, found chiefly in Sierra Leone, inhabiting the mountainous plateaux; but this term is also applied popularly to other species. The B. A. above alluded to, and which is the form most commonly denoted by this name, attains a height of about three feet at the shoulders. Its colour is brown, and streaked with fawn or light-yellow on the hinder part of the back; and from this latter peculiarity the name of 'white-backed' B. A. has been applied to this species. It is a timid species, lying concealed in thickets by day, and feeding in twilight or at dusk. Its flesh is highly esteemed, but is said at certain times to possess a musky odour. The legs are shorter and thicker than in most other antelopes. The other species of the genus *Cephalophus* usually possess horns in the male sex only, and the forehead is furnished with a tuft of hair. The pigmy antelope or blue buck (*C. pygmaus*) of S. Africa, 12 inches high, is nearly allied to the B. A.

Bushab' (properly *Khoshaub*, 'good water'), a long, narrow, and low, but well-peopled island in the Persian Gulf, 212 miles S. W. of Abushir. It has a harbour and town at its west end.

Bushel, an English measure of capacity for dry materials, containing eight gallons.

Bushire'. See **ABUSHEHR**.

Bushman Language, a form of the so-called 'click-language,' spoken by the Bushmen or Bosjesmen (q. v.) of S. Africa. It is of scientific interest mainly as an aboriginal tongue, and as a rich repository of native legend and folklore. Phonetically it is most repellant, comprising deep gutturals and a great variety of clicks, uttered with a sharp nasal twang. The late Dr W. H. J. Bleek, curator of Grey Museum, Cape Town, has collected almost all that is yet known of the B. L. in his still unpublished *B. Grammar and Dictionary*, and his *Brief Account of B. Folklore and other Texts* (1875).

Bush'nell, **Horace**, was born in New Preston, Connecticut, in 1802, graduated at Yale College, 1827, and was for a time editor of a newspaper, but was ordained minister of a Congregationalist church in Hartford, Connecticut, in 1833. He resigned in 1858. B. early became famous both as a thinker and speaker. In 1847 he published *Christian Nature*; in 1849, *God in Christ*, for which he was tried for heresy, but acquitted; in 1851, *Christ in History*; in 1858, *Nature and the Supernatural*; and since then, *Sacrifice*, *Law*, and *Forgiveness*, and other works. B. was one of the most subtle thinkers and able theologians of New England. He died at Hartford, Feb. 17, 1876.

Buskin (*L. cothurnus*), a high-heeled shoe worn by ancient actors in tragedy, hence used figuratively for tragedy, as the sock (*soccus*) for comedy. Thus Milton speaks of the 'buskin'd,' i. e., the tragic, stage; thus, also, in the *Return from Par-nassus*—

'Marlowe was happy in his buskin'd muse.'

Bussahir, or **Bassahir**, a native state of Northern India, in feudal subordination to the Punjab Government. It lies on the southern flank of the Himalayas, and is traversed from E. to W. by the Sutlej. B. has all varieties of climate and vegetation, from subtropical to frigid. The country seems to be rich in minerals, copper ore especially being abundant. Its area is estimated at 2560 sq. miles, and its pop. at 55,000, and the revenue at nearly £7000. The rajah, who is a Rajput, pays an annual tribute of £394, 10s.

Bussesserhat, a town of India, province of Bengal, in one of the 24 pergunnahs division, has a pop. (1871) of 12,105.

Bussu Palm (*Manicaria saccifera*), a native of the tidal swamps of the Amazon river. Of the leaves of this, as of many other palms, thatch is formed. Bags are made of the entire spathe, and the larger ones are stretched to form a material out of which caps are manufactured.

Bust (Ital. and Span. *busto*, Fr. *buste*), in sculpture, is a statue truncated below the breast. In Latin *bustum* signifies the reverse—the trunk of the body without the head. The ancient

Herma were heads (originally of Mercury) placed on a four-sided pillar. Though perhaps the origin of the B., they are not identical with it—the modern B. including shoulders, breast, and the upper part of the arms. Portrait busts do not appear in Greece till Alexander's time; those of Rome afford faithful likenesses of the emperors and great men of the city. England has excelled in this branch of sculpture, Chantrey being especially famous for his skill in it. The greatest modern collection of busts is that formed by King Louis of Bavaria; engravings of ancient ones are given in Visconti's *Iconographie Grecque* (Par. 1811) and *Iconographie Romaine* (1817).

Bustard (*Otis*), a genus of *Grallatorial* or Wading birds, included in the family *Otidæ*, in which the bill is short and

stout, convex, and broad at the base; the nostrils placed in a membranous groove, feathered at its upper portion; the legs long and slender, the toes short, and provided with convex claws, and the hinder toe absent. The wings are powerful, and of pointed conformation, and the tail is elongated. These birds differ in many points from ordinary waders, chiefly in the shape of the bill and in habits. They are closely allied on the one hand to the *Cursores* (q. v.), and on the other to the *Rasores* (q. v.). They inhabit the Old World, and chiefly live in heaths and dry plains. They feed on

worms, insects, reptiles, and even small mammals, and also eat vegetable matters. The Great B. (*Otis tarda*), formerly abundant in Wilts and Norfolk, is now comparatively rare in Britain, but occurs in S. and E. Europe, and in Central Asia. The male measures from 3 to 4 feet in length, and the female 3 feet, the former sometimes weighing 30 lbs. or more. The young birds are considered good eating. The upper parts are of chestnut colour varied with black; the wings being black and white, and the tail tipped with the latter colour. The chin of the male in summer bears underneath, and on each side, a tufted plume about 6 or 7 inches in length, this plume covering a bare portion of skin on each side of the head and neck. No gular pouch (such as exists in the pelicans), formerly described as present in the males of these birds, exists. These birds are polygamous, and are readily tamed, but do not appear to breed in a domesticated state. The Little B. (*O. tetrax*) inhabits the borders of the Mediterranean Sea, but occasionally visits Britain. Its average length is 17 inches. Other species are the *O. caruleus* of Africa, and the S. African Kori (*O. kori*), the Australian B. (*O. Australasianus*), and the Asiatic or black-headed B. (*O. nigricaps*), found chiefly in the Mahratta plains, and highly esteemed in India.

Busto-Arsizio, a trading town of N. Italy, province of Milan, 20 miles N.W. of the city of Milan, has several fine churches, with remains of several ancient buildings. Some cotton manufactures are now carried on. Pop. about 10,000.

Butala, a town of India, province of the Punjab, executive district of Gurdaspur, has a pop. (1868) of 28,725.

Butcher-Bird. See **SHRIKE**.

Butcher's Broom (*Ruscus*), a genus of plants belonging to the natural order *Liliaceæ*. *R. aculeatus*, the common B. B., is a shrubby evergreen plant remarkable for the flowers being formed on leaf-like branches (*Cladodia*, q. v.). It derives its name from butchers using it to sweep their blocks. The roots are aperient and diuretic, and at one time were much used in diseases of the bowels. The roasted seeds have been used as one of the many substitutes for coffee.

Bute, an island in the Firth of Clyde, Scotland, separated from Argyllshire by the Kyles of B., a picturesque winding channel less than a mile in width. It is 5 miles from the Ayr-

Bustard.

shire coast, and 6 miles N.E. of Arran. B. is 18 miles long, and from 3 to 5 broad, with a pop (1871) of 10,064. Nowhere does it rise to a great elevation, and much of it, especially in the centre and S., is low, and produces excellent crops, the principal of which are oats, wheat, barley, and green crops. The coast is rocky; in the interior are several small lakes, and slate, limestone, and freestone are found. On account of its mild and moist climate, B. is called the 'Devonshire of Scotland,' and is much resorted to by invalids. Rothesay, a fashionable watering-place, is the chief town, about 4 miles S. of which is Mount Stuart, a seat of the Marquis of B., who owns most of the island. Dungyle, a vitrified fort on the S.W. coast, Kames Castle, and the Devil's Caldron, a circular structure 30 feet in diameter and 10 feet high, are the principal antiquities.

Buteshire, comprising B., Arran, the Cumbræes, Holy Isle, Pladda, and Inchmarnock, has an area of 225 sq miles, and a pop (1871) of 16,977. The valuation for 1874-75, exclusive of the burgh of Rothesay, was £54,290. B. returns one member to Parliament.

Bute, John Stuart, Third Earl of, was born in 1713. He is chiefly memorable as having had a great influence in the earlier years of the reign of George III. He had been one of the lords of the bedchamber to his father, Frederick, Prince of Wales, and was groom of the stole to the King himself. After being a chief Secretary of State, he was Prime Minister from 29th May 1762 to 8th April 1763, and, partly because he was a Scotchman, partly because he was a staunch upholder of the royal prerogative, he became very unpopular. He soon retired from politics, although he long exercised an influence over the King, and died 10th March 1792. Apart from politics, B. was an amiable man, with some literary tastes, he was also much given to scientific pursuits. The present representative of the family, John Patrick Crichton Stuart, Marquis of B., was born in 1847. He is distinguished for his great wealth, which had accumulated during a long minority, and for his conversion to Roman Catholicism.

Buttea, a genus of plants belonging to the sub-order *Papilionaceae* of the natural order *Leguminosae*. *B. frondosa* and *B. superba*, large shrubs or small trees, natives of India, are the best known. The red resinous tears which exude from the twigs constitute one of the kinds of Lac (q. v.) sold in the Indian markets. It is believed to be formed by insects, as the juice of the tree is colourless. From the roots of *B. frondosa*—the *Dhak* tree of India—fibre ('Pulos cordage') used in caulking boats is extracted. The flowers yield a beautiful yellow or orange dye. It yields a gum known in commerce as *B. gum* or *Bengal Kino*, used in India in diarrhoea and similar diseases, and in tanning, &c. *B. parviflora* also yields a similar substance. The seeds of *B. frondosa* are considered in India a powerful vermifuge.

Butera, a town in the Sicilian province of Caltanissetta, on the Manfria, 8 miles N.N.W. of Serranova. Pop. 5150. B. was besieged by the Saracens in 853, and taken by the Normans in 1089. It has a castle belonging to the Norman period, and extensive ruins of an older antiquity are found in the vicinity.

Butler, Benjamin Franklin, was born at Dedfield, New Hampshire, United States, 5th November 1818. He graduated at Waterville College, Maine, in 1838, studied law in Lowell, Mass., and was admitted to the bar in 1841. He soon became noted in Lowell, and throughout the state, as a criminal lawyer and an active Democratic politician. In 1853 he went to the State Legislature, and was in the State Senate, 1859-60. B. was a delegate to the Democratic Convention which met in Charleston, 1860, and he there supported the nomination of John Breckenridge, the extreme Southern candidate. At the outbreak of the war in 1861, he took the Union side, and marched to the field with the 8th Massachusetts Brigade. He received a check at Great Bethel, but was promoted to the command at Baltimore, and afterwards to E. Virginia. After Admiral Farragut took New Orleans, B. held military possession of the city, and became notorious for the severity of his rule, especially in regard to Southern women. He acted under General Grant before Petersburg, but having refused to co-operate with the naval forces, he caused the failure before Fort Fisher, and was relieved of his command. General Grant expressing disapprobation of his procedure. Returning

to Massachusetts, he was elected to Congress in 1866, rapidly gained the confidence of President Grant, and became a power in the Legislature. In 1871 he tried to get the Republican nomination for the Governorship of Massachusetts, but was defeated by Washburne. In the autumn of 1874 he lost his seat in Congress. B. is an acute lawyer and politician, but is distrusted by a considerable section of the American people.

Butler, Joseph, one of the most distinguished theologians that Britain has produced, was the son of a Dissenting shop-keeper at Wantage, in Berkshire, and born 18th May 1692. He was educated originally for the ministry of the Presbyterian Church, but conformed, studied at Oriel College, and took orders. In 1718 he was appointed preacher at the Rolls Chapel, and in 1725 rector of Stanhope, in the county of Durham, where he lived in such retirement that Queen Caroline believed he was dead. In 1733 he became Prebend of Rochester and chaplain to Lord Chancellor Talbot, in 1736, Clerk of the Closet; in 1738, Bishop of Bristol, in 1740, Dean of St Paul's; and in 1750, Bishop of Durham. He died at Bath, June 16, 1752, and was buried in Bristol Cathedral. Both as a man and as a prelate, B.'s character stands deservedly high; he was at once liberal and judicious, gentle and shrewd. But it is as a metaphysician and a theologian that B. will be best remembered. He showed his remarkable powers at the age of twenty-two, in the letter which he wrote criticising Dr Samuel Clarke's *Demonstration of the Being and Attributes of God*, and still later in his sermons originally delivered when he was preacher at the Rolls Chapel, and published in 1726. In 1736 appeared his greatest work, *The Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature*, the object of which, as the title implies, is the defence of revealed religion, on the ground that the general analogy between the principles of divine government as revealed in the Scriptures and those shown in the course of nature leads to the conclusion that the author of them is the same. Whatever may be thought of the convincing nature of the reasoning in the *Analogy*, there can be no question as to its strength and closeness. In three of his sermons on *Human Nature*, B. laid the basis of much of the later English ethical philosophy, maintaining as his cardinal principle the supremacy of conscience. See M. Arnold, *Bishop Butler and the Zeit-Geist*; Leslie Stephen, *English Thought in the 18th c.*; and the Rev. J. R. T. Eaton, *Bishop Butler and his Critics* (Lond. 1878).

Butler, Samuel, author of *Hudibras*, was born in 1612, at Streatham, Worcestershire, where his father had a small farm. He was educated at Worcester grammar-school and at Cambridge, but did not graduate. After acting as clerk to a justice of the peace, living in the household of the Countess of Kent, and acting as amanuensis to the learned Selden, he entered the service of a Puritan colonel, Sir Samuel Luke of Bedfordshire, who seems to have been the prototype of *Hudibras*. After the Restoration, B. became secretary to Lord Cauberry, who made him steward of Ludlow Castle. He published the first part of *Hudibras* in 1663, and the second part in the following year. *Hudibras* at once became the favourite book of the age, but, while the King was incessantly quoting it, the author owed his escape from starvation to the liberality of a friend. The third part of *Hudibras* appeared in 1678, and on the 25th September 1680 its author died, unrequited by the Royalists whom he had so brilliantly amused and served. B.'s life is hidden in obscurity. We know little more than that he latterly suffered great distress, and died in extreme indigence. B. was not merely a zealous anti-Puritan, he hated courtly license as well as sectarian cant. He satirised the 'royal society' in *The Elephant in the Moon*, alluded to the profligacy of Whitehall in the *Enchanted Bower of Hudibras*, and among his remains is a satire on *The Licentious Age of Charles II*.

Hudibras is a pasquinade ridiculing the Puritans in the persons of a Presbyterian colonel and Independent squire, who are involved in ludicrous controversies and farcical mishaps while seeking to repress popular amusements. The book is replete with grotesque drollery, recondite learning, trenchant irony, novel and felicitous rhymes, aphoristic couplets which have passed into general use, and quaint, caustic, and sparkling wit, unexcelled by any English writer. In his use of whimsical illustrations, B. resembles Donne and Cowley, with the advantage that his conceits are in keeping with his burlesque theme and riotous merriment. The best edition is that by Robert Bell (3 vols. Lond. 1861).

Butler, William Archer, a theological and philosophical writer, was born at Annerville, near Clonmel, Ireland, in 1814. He studied at Trinity College, Dublin, was appointed, in 1837, Professor of Moral Philosophy there, and died 5th July 1848. His *Lectures on the History of Ancient Philosophy* (2 vols. Camb. 1856, edited by W. H. Thomson) display great learning and philosophical acumen. His *Sermons* (Dub. 1849) are remarkable for eloquence, taste, and judgment. Other works are *Letters on the Development of Christian Doctrine* (Dub. 1850), *Letters on Romanism* (Lond. 1854). All B.'s works are posthumous.

Butlerage of Wine, an ancient duty on wine falling to the crown. It is otherwise called the *prisée* of wine. The crown was entitled to take two tuns of wine from every English or foreign ship importing into England twenty tuns or more. This was changed to a money-tax under Edward I. It was payable to the king's butler, hence the name.

Butomus, a genus of flowering plants of the natural order *Alismaceæ*, of which one species, 'the flowering rush' (*B. umbellatus*), is found in watery ditches and shallow ponds and streams; dispersed 'over the greater part of Europe and Central and Russian Asia to the Arctic regions; represented in N. America by a slight variety, now said to be a distinct species; in Britain, limited to England and Ireland, with the exception of a single station near Paisley, in Scotland' (Bentham). It is a very beautiful plant.

Butomus umbellatus.

Bu'ton, an island of the Malay Archipelago, separated from the S. E. end of Celebes by B. Strait. The Dutch, to whom it belongs, used to destroy the clove-trees, as interfering with their monopoly in cloves. In character and produce it resembles generally Buru (q. v.).

Butter (Lat. *butyrum*) is the solid fat obtained from the milk of all mammalian animals, but in commerce it is only the B. obtained from cow's milk which is met with. The fat is disseminated through new milk in minute globules enclosed within a thin sac or membrane, and being specifically lighter than the fluid in which it floats, it gradually rises to the surface as *cream*. The prolonged agitation of cream, such as is accomplished in any of the numerous forms of Churn (q. v.), ruptures this membrane, and the escaped fatty particles agglutinate to form B. It is found that the making of B. is facilitated by a heat of about 60° F., and on this account a small quantity of hot water is usually added to the cream before churning. B. is also prepared from new milk before the cream has had time to rise to the surface. Pure B. is composed of several fatty principles, the chief of which are stearine, margarine, and oleine (butyroleine), which together should form about 98 per cent. of the fat, the remainder consisting of minute portions of butyrine, caprine, and caproine, to which the peculiar aroma and taste of B. is due. In addition to these fats, B. always contains a certain percentage of casein, water, and salts. Good sweet B. should have a straw-yellow colour, a firm, but not hard consistency, and a faint, pleasing odour and taste. It becomes rancid on keeping, owing to a fermentation set up by the nitrogenous casein which it always contains; but the more carefully the B. is prepared and washed, the longer will it keep fit for eating. Keeping B. in water renewed from day to day also tends to retard rancidity, and it is said that water acidulated with 2 per cent. of acetic or tartaric acid is an excellent preservative medium. The usual way of preserving B. is by salting, and the quantity of salt varies with the length of time the B. is to remain unused. Powdered B. is very lightly salted for immediate consumption, and in this form B. is chiefly used in English towns, where entirely fresh B. is little consumed. Fully salted B. should have worked into it about one ounce of salt to every pound, and it should be carefully covered from the air. In using, the surface should be kept covered with a strong brine containing saltpetre. A salting compound, composed of one part of nitre, one of sugar, and two

of salt, also gives excellent results. B. is imported into this country in enormous quantities from Holland and Denmark, and in the N. of Ireland large quantities are made for export. The B. of different localities varies considerably in richness of flavour, chiefly owing to the feeding of the cows, and, to a less extent, on account of the treatment of the milk. B. is often adulterated by the addition of lard and other animal fats, flour and potato starch, curd, &c., and its bulk is fraudulently increased by working up water with it. An artificial fatty compound has been proposed as a substitute for B. under the name of 'butterine,' and a good deal of so-called B. might be honestly sold under that name. The colour of inferior and factitious B. is improved by annatto paste.

Butteroup. See *RANUNCULUS*.

Butterfish. See *GUNNEL*.

Butterfly, the popular name of the typical insects belonging to the order *Lepidoptera* ('scale-winged'), and to the *Diurnal* section of that group. The butterflies are included under a great number of genera and species, forming numerous families. As in other *Lepidoptera*, the mouth is eminently of the *suctorial* type, and adapted for sucking up the juices of flowers. Thus a spiral *proboscis* or *antlia*, formed of the modified *maxilla* or lesser jaws, exists as the chief organ in the B.'s mouth. The wings are four in number, and are covered with minute feather-like scales of varied shapes, which being coloured by metallic tints and lustres, and being marked by microscopic lines or *striae*, possessing refractive properties, cause the wings to exhibit the gorgeous hues so familiar to all. The butterflies of the tropics possess the most vivid and gorgeous colours. The wings when at rest are held erect, those of the moths being generally dependent, and coloured on the upper side only. The wings of butterflies also differ from those of moths, in that when flying they are separated, and not attached together by means of hooked processes, or *retinacula*. The antennæ of butterflies are knobbed. The larvæ or caterpillars possess six true or *thoracic*, and ten false, or *pro-legs*. The *pupa*, or *chrysalides*, are always attached by the posterior extremity, or head downwards, and often exhibit angular shapes and forms. The pupæ are further rarely enclosed in *cocoons*, but are contained within the larval skin, from which the *imago*, or perfect-winged insect, finally escapes. These forms thus exhibit the typical or complete form (*Holometabolic*) of *Metamorphosis* (q. v.), in which the larvæ are active, and the pupæ quiescent.

Pontia Brassica.

Butterflies are widely distributed, and occur in all quarters of the globe, but attain their largest size and most luxuriant appearance in tropical regions. All of these insects fly well and rapidly, and appear in some instances—as seen in the tropics—to migrate suddenly and unaccountably to distant parts. The eggs are deposited on leaves, which are eaten by the developing larvæ. The period at which the eggs are hatched varies greatly; in some cases, a few hours may suffice in summer, whilst in other cases, the eggs deposited in autumn are not hatched until the succeeding spring or summer. The larvæ are exceedingly destructive to the leaves of plants, and commit much havoc in gardens and nurseries. The caterpillars vary in appearance according to the species of B. of which they are the immature forms.

These insects are named *Diurnal Lepidoptera* from their habit of flying abroad during the day, and in contradistinction to the moths or *Nocturnal* forms. The group includes two main sections; the families of the first being distinguished by the possession of a single pair of spines on the tibiae of the legs; those of the second group possessing two pairs of spines on the tibiae of the hinder pair of legs. The most familiar forms belong to the family *Papilionida*, of which the peacock B. (*Papilio* or *Vanessa Io*), the tortoiseshell (*V. Urtica*), the red admiral (*Vi. Atalanta*), &c., are well-known examples.

Cynthia Cardui.

The Painted Lady (*Cynthia Cardui*) is remarkable as occurring in almost every quarter of the known world. The common white cabbage B. (*Pontia Brassicae*), the larvæ of which are the pests of the gardener, is the best known of the more common species. Other forms are the copper butterflies (*Polyommatus*) and the blue B. (*Lycana*). See also articles on the CABBAGE B., PURPLE EMPEROR, and other typical species.

Butterfly-Fish. See BLENNY.

Butterfly-Weed, or Fleury's Root, is derived from *Asclepias* (q. v.) *tuberosa*. The plant is a native of the United States. It has a large tuberous root, with a bitter nauseous taste. It has been used, especially in America, as a medicine. In small doses it causes sweating, and in large doses purging. The root is the part used, and has been highly recommended in pleurisy. It is best given in the form of an infusion. The dose corresponds to 20 or 60 grains of the root several times a day.

Butter-Milk, the liquid which remains after the churning of cream or sweet-milk for the preparation of butter. Although deprived of much of the fatty matter of milk, it is still a highly nutritious and healthy beverage, and is much used by both the Irish and the Scotch—by the former in conjunction with potatoes, and by the latter with oatmeal porridge. Its average composition may be stated thus: nitrogenous matter, 4.1; fat, 0.7; sugar of milk, 6.4; salts, 0.8; water, 88.0.

Butter, Rock, a mineral occurring in several places on the continent of Europe, and also at Hurler near Paisley. It exudes from rocks containing alum or its constituents—particularly from alum-slate, and other schistose rocks. It is greasy to the touch, easily broken to pieces, and varies in colour from yellowish white to sulphur yellow.

Butter-Tree, a name given to several trees of the genus *Bassia* (natural order *Sapotaceæ*), on account of the solid fat yielded by their fruits. *Bassia butyracea* and *B. latifolia* are both natives of India, where the solid fat from their seeds is used for culinary and other purposes. The flowers of *B. latifolia* (Moh-wah flowers) are used as food, and yield a spirit on distillation extensively consumed in the East. *B. Parkii*, named after Mungo Park the traveller, yields a similar fat, on the W. African coast, where it is known as Shea Butter.

Butterwort (*Pinguicula*), a genus of plants of the natural order *Lentibulariaceæ*. The common B. (*P. vulgaris*) grows in common and wet ground very generally over Great Britain, and is found as far N. as Greenland. It has the power of coagulating milk, hence its name; or, as some say, it derives its name from its smooth shining leaves. Berwickshire shepherds call it *Rotweed*, from an idea that it causes 'rot' in sheep.

Buttisholz, a village in the canton of Lucerne, Switzerland, 11 miles N.W. of Lucerne, celebrated as the place where De Coucy, son-in-law of Edward III. of England, was defeated by the Swiss peasants. The *English Barrow*, a large mound near the village, marks the grave of 3000 of his followers.

Buttman, Philipp Karl, a celebrated German philologist, was born at Frankfurt-on-the-Main, 5th December 1764. After studying at Göttingen, he became assistant in the royal library at Berlin in 1789, secretary in 1796, and chief librarian in 1811. In 1800 he accepted a mastership in the Joachimsthal Gymnasium in Berlin, and on the institution of the University of Berlin in 1808, though he held no special professoriate, devoted his energies to promote its prosperity, and foster the talents of the more promising youth, his house being the rendezvous of all the distinguished scholars in Berlin. B. died 21st June 1829. The best known of his valuable contributions to Greek philology are his *Griech. Grammatik* (Berl. 1792; 22d ed. 1869), and his *Lexilogus für Homer und Hesiod* (Berl. 1818-25; 2d ed. 1860), of which an excellent translation by Fishlake has long been a popular book of reference at British universities. His editions of classic authors are highly valued. The latest edition of B.'s grammatical works is that by his son Alexander (1859).

Button (Fr. *bouton*, from *bouter*, 'to push or place'), a familiar appendage of dress, worn for fastening as well as for the purpose of ornamentation. The use of buttons is as general

as the use of civilized clothing, of which they form an indispensable part. Buttons are not mentioned in English literature till the time of Edward I., in whose reign the habit of servants aping their masters is thus satirised—

'Now the horse-clawers, clothed in pride,
They buak them in buttons as it were a bride.'

From this period the use of buttons for ornament as well as use has continued to the present day, with fluctuations in fashion occasionally affecting the demand. In the time of William and Mary, it was represented to Parliament that thousands of men, women, and children 'depended on the making of silk, mohair, thread, and gimp buttons, and that the makers of such needle-work buttons were injured by the wearing of buttons made of threads of cloth, serge, drugget, frieze, camlet, and other stuff and materials.'

The manufacture of buttons at the present day is principally carried on at Birmingham, Paris, Lyons, Vienna, and in several German towns. As they are made from an endless variety of materials, the processes by which the manufacture is conducted are greatly diversified; but generally they may be divided into four classes—1st, pearl and other turned buttons; 2d, metal buttons; 3d, covered buttons; and 4th, fancy buttons. In the making of pearl buttons, no further machinery is required than a foot-lathe and cutting and boring tools. Pearl B.-making is, on this account, extensively pursued as prison labour in France; and it is estimated that in Birmingham more than two thousand people find occupation in this branch. The mother-of-pearl out of which the buttons are turned consists chiefly of the bivalve shells of *Meleagrina Margaritifera*, and are imported from the East Indian seas, Manilla, and the Eastern Archipelago, and from Panama. The processes employed in making pierced bone and ivory buttons are the same as in the case of pearl buttons, and there are many other materials similarly turned. Among the substances largely so used may be enumerated vegetable ivory or Corosso nuts, which are the fruit of a South American palm (*Phytelephas macrocarpa*), betel-nuts, (*Areca catechu*), and boxwood, ebony, and coco wood, &c. Metal buttons are made for army, navy, livery, hunting, college service, and generally for all uniform purposes, besides for the ornamentation of the dresses of ladies and children. They are made of various metals and alloys, in the form of plain flats, chased flats, dead gold, coloured gold, plated gold, die stamped, engine turned, silvered, oxidised, and bronzed, besides in numerous other forms of metal combined with other materials. Livery buttons have usually a crest in relief on their surface struck from a die, and some of the old hunting buttons had designs of much spirit and artistic merit struck on them. The stalks of solid metal buttons are fastened by hard solder; and when gilt, it is now done by electro-plating; but silvered livery buttons are struck from the old form of plated silver. The consumption of metal for B.-making in Birmingham alone was, several years ago, estimated at from six to eight tons weekly, exclusive of iron and tin, of which probably twice as much was used. The manufacture of metal buttons is, however, a declining industry, as it has been largely superseded by covered buttons. In the reign of William and Mary an Act was passed imposing a penalty of 40s. on the making and using of every half-dozen of covered buttons, in consequence of the representations above alluded to. But in spite of legislative prohibition this style of B. has grown in favour till it now overshadows all others. The covered buttons with flexible cloth shanks, such as worn on dress-coats, are made by means of hand-stamping presses, and the series of operations are rather numerous. The iron ring, through which the cloth shank on the under side protrudes, is cut out of sheet-iron, pierced, stamped, and japped in four operations, and the disc of cloth for the shank is cut out and placed in the ring in two operations. The stamping out of the shell over which the B. cover is stretched involves three operations; a disc of millboard has to be stamped out to fill up the interior of the B., and circular discs of the covering material have similarly to be stamped out before all these various pieces are brought together to be fastened by a hand screw-press into the complete B. The processes employed in making linen-covered buttons, and in all fancy silk-covered buttons, are very similar to the above, but when the tops are rounded, the 'shells' require to be struck several times in the die, between each of which blows the metal has to be annealed. Horn buttons,

which are really made from the hoofs of cattle, are chiefly manufactured in France, and a Frenchman, M. Emile Bassot, was the inventor of the appliances by which they are cut, and the designs on them stamped in relief. Glass buttons are moulded by pinching the material in a half soft condition in a pair of hot pincers in which a die with the design to be produced is set; and when such buttons are cut or faceted, it has to be done by the ordinary processes. Porcelain buttons, in imitation of pearl shirt-buttons, are also very largely made in France, and they can be produced so cheaply that a great gross (144 by 144) is sold, mounted on paper, for about 11d. Fancy buttons are also made of papier-mâché, vulcanite, many composite materials, marbles, and fancy stones; and indeed it is difficult to say what material is not used. The Chinese and Japanese expend much artistic skill and ingenuity in the carving of ivory and wood buttons of large size, and some of them are of great value.

Buttress, a projection from a wall for the purpose of increasing its stability. Buttresses are made in various forms, corresponding to the style of architecture of the building to which they belong. They do not occur at all in Grecian buildings, or buildings in the Grecian style. 'Flying buttresses' are in the form of a sloping arch connecting the upper and central part of a building (as, e.g., the clerestory) with the side walls. They are generally used to transmit part of the thrust of an arched roof to the outer buttresses, when the inner wall or column does not possess sufficient stability to resist the thrust alone.

Buttress from Cologne Cathedral. PELOS.

Bu'tua Root. See CISSAM.

Butyric Acid is an oily liquid occurring in small quantity as a glyceric ether in fresh butter, and in the free state in rancid butter, in human perspiration, the juices of animals and of some fruits, and in minute quantity in the waters of certain lakes. *Butyrate of calcium* is best prepared by allowing a mixture of chalk, sour milk, sugar, and decayed cheese to remain for some months in a warm place; fermentation takes place, and in the first instance the sugar is resolved into lactic acid.

Grape sugar. Lactic acid.

The lactic acid subsequently decomposes into B. A., carbonic acid, and hydrogen—

To extract the B. A., the product of the above reactions is boiled with carbonate of soda, filtered, evaporated to small bulk, mixed with sulphuric acid, and the oily layer which separates decanted and distilled. B. A. is a colourless, oily liquid of peculiar and characteristic odour, recalling at the same time the smell of cheese, rancid butter, and pine-apples. It is miscible in all proportions with alcohol and ether, and is also soluble to a considerable extent in water. It boils at 157° C., and is lighter than water (sp. gr. '98). It forms crystalline salts with the metals which are of no practical importance.

Butyric Ether, or Pine-Apple Oil, is used in confectionery and perfumery. It may be obtained by distilling a mixture of butyric and sulphuric acids with alcohol, but is prepared commercially from butter. The butter is saponified with potash, and the resulting soap is dissolved in alcohol, and distilled with sulphuric acid as long as anything volatile passes over. B. E. possesses the characteristic odour of pine-apples, and indeed is the cause of that odour in the fruit. It is also present in pine-apple rum. It boils at 119° C., is lighter than water (sp. gr. '9), and has the chemical formula $\text{C}_4\text{H}_8\text{O}_2(\text{C}_2\text{H}_5)$.

Buxar, a town of British India, province of Bengal, district of Shahabad, on the Ganges, 398 miles N.W. of Calcutta. It is historically interesting as the scene of the great victory won (October 23, 1764) by Major Munro, with a force of 7072 men, over a native army 50,000 strong, under the Nabob Vizier of Bengal—a victory which made the English masters of the entire valley of the Ganges, from the Himalaya to the sea, and placed Hindustan at their feet' (Marshall's *Hist. of Ind.* c. xi.). Pop. (1872) 13,446.

Buxbaumia, a genus of mosses, of which only one species (*B. aphylla*) is known. Minute scales take the place of leaves.

Buxton ('the town of beech-trees'), a market-town and watering-place in the N.W. of Derbyshire, 33 miles N.W. of Derby, and 160 miles from London. It is a station on a branch of the Midland Railway. B. lies in a moorland dell near the source of the small river Wye, which flows into the Derwent. The waters of its calcareous and chalybeate springs have been in use since the time of the Romans. They were greatly in vogue before the Reformation, and, since the present baths were rebuilt, rank among the finest in Europe. The waters are taken for cutaneous and nervous diseases, indigestion, rheumatism, and gout. From June to October B. is visited, on an average, by 12,000 to 14,000 persons, and can accommodate nearly 5000 strangers at one time. The Devonshire Hospital, supported by subscription, contains 100 beds, and lodges and boards annually nearly 1000 patients free of charge. A striking feature of the town is the magnificent Crescent, built about 1780 by the Duke of Devonshire, in which there are two hotels, a library, assembly-rooms, &c. Pop. (1871) 3717. Diamond Hill, well known for its crystals, and the stalactitic caverns, Poole's Hole, 560 yards long, are interesting objects in the neighbourhood.

Buxton, Sir Thomas Fowell, a noted philanthropist, was born at Earl's Colne, in Essex, 1st April 1786. Educated at the University of Dublin, he threw his energy, which, physical as well as mental, was immense, into the trade of brewer, and speedily made a great fortune. He had married a sister of Mrs Fry, the well-known philanthropist, and this fact, acting upon a manly religious nature, made him enter heartily into the philanthropic schemes of the period. He entered Parliament as member for Weymouth, and, till he was ousted in 1837, was one of the most earnest advocates in Parliament of slave emancipation and the amelioration of prison discipline. B. was made a baronet in 1840, and died at Northrepps, February 19, 1845. See *Memoirs of Sir Thomas Fowell B.* (Lond. 1848; 3d ed. 1851), edited by his third son, Charles Buxton (born 1822, died 1871), whose premature death deprived England of a high-toned politician and an accomplished writer.

Bux'torf, Johann, 'the prince of Hebrew scholars,' was born at Kamen, in Westphalia, 25th December 1564, and after studying at Marburg, Basel, and Geneva, became Professor of Hebrew at Basel in 1591, and died 13th September 1629. Such was his proficiency in matters connected with Hebrew literature, that it is said even the Jews resorted to him for counsel. His chief works are *Biblia Hebraica Rabbinica* (4 vols. Bas. 1618-19); *Tiberias seu Commentarius Massoriticus* (Bas. 1620); and *Lexicon Hebraicum et Chaldaicum* (Bas. 1607).—His son, also called **Johann**, and known as the 'younger B.,' was born at Basel, 13th August 1599. He rivalled his father in his acquaintance with Hebrew, and succeeded him in the Hebrew chair at Basel, where he died, 16th August 1664. B. was involved in a controversy with Capellus, in which he maintained the divine authority of the entire Masoretic text, vowels and consonants, words and things. Among his works are a *Lexicon Chaldaicum et Syriacum* (Bas. 1622); *Lexicon Chaldaicum, Talmudicum et Rabbinicum* (Bas. 1639), partly from his father's literary remains; and *Concordantia Bibliorum Hebraicorum* (Bas. 1622).—**Johann Jakob B.** (born 1645, died 1704), son of the preceding; and **Johann B.** (born 1663, died 1732), nephew, were also Professors of Hebrew at Basel.

Buxus. See BOX.

Buyukdereh, a charmingly situated suburb of Constantinople, on the Bosphorus, and a favourite residence of the Christian ambassadors.

Buzzard (*Buteo*), a genus of Raptorial birds, forming the type of the sub-family *Buteonina*, and nearly allied to the Falcons.

Honey Buzzard.

In general form, the buzzards are intermediate between the hawks and kites and eagles. The bill is broader at the base than in the hawks, and is compressed at its point, the sides being sloping, and the margins sinuous or festooned. The cere covers the base of the bill. The wings are long and rounded, the third and fourth quills being the longest. The legs are strong and short, and the tarsi may be naked or feathered partly or completely. The toes are short. Buzzards when seeking prey fly slowly, and at a short distance from the ground. They feed chiefly on the smaller mammals and birds, though also on worms,

reptiles, &c. Buzzards chiefly occur in the New World, but are common in the eastern hemisphere. The common B. (*Buteo vulgaris*) averages 20 inches in length, and inhabits Britain permanently, occurring also in Europe, N. Africa, Asia, and N. America. The upper plumage is brown, varied with black, the under parts being of a white or greyish-white colour. The extended wings may measure 4 feet from tip to tip. This bird may exhibit a tendency to domestication, and the females have been repeatedly known to hatch and bring up broods of chickens. The rough-legged B. (*Buteo or Archibuteo lagopus*) is rarer in Britain than the common B., but is distributed generally over the European and African continents, and in the United States of America. The tarsi are covered with feathers even to the toes, and this species is of larger size than the common B. The European honey-B. or bee-hawk (*Pernis apivorus*) is rare in Britain, where it is a summer visitant only, but occurs in Europe. It feeds upon bees and wasps. An allied Indian species (*P. cristata*) feeds on caterpillars, and others on honey. The red-tailed hawk or B. of N. America (*B. borealis*) destroys poultry; and other species are the jackal-B. of S. Africa (*B. jackal*)—so named from the sound of its voice resembling the jackal's cry—and the *B. melanosternon* of Australia. The Marsh-harrier (q. v.) sometimes receives the name of moor B., and the Osprey (q. v.) is occasionally known as the bald B.

Byblos, a very ancient maritime town of Phœnicia, a little to the N. of Beirut, and the chief seat of the worship of Adonis, was the same as the Gebel of Ezekiel xxvii. 9, in which passage the LXX. has *Bibians*. The modern Arab name is Jebel. There was also an Egyptian B. in the Delta of the Nile, which took its name from the *byblus* or papyrus plant, extensively manufactured here in ancient times into writing material.

Bylaws. Every corporation has power to make private laws, called B., for the government of itself; and these laws are binding, unless contrary to the law of the land or to the charter of the corporation. Under the Municipal Corporation Act, a borough council may make certain B. for the borough, subject to the approval of the Privy Council. The Board of Trade exercises a supervision over the B. of railway and some other public companies.

Byng, George, Viscount Torrington, a British admiral, was born at Wrotham, in Kent, 27th January 1663, entered the navy at an early age, rapidly rose in the service, took the side at the period of the Revolution of the Prince of Orange, and in 1703 became Rear-Admiral of the Red. He distinguished himself at the taking of Gibraltar and the battle of Malaga, and commanded, in 1715, the squadron which forced a French fleet that was intended to cover an invasion of Scotland by the Pretender to retire to Dunkirk. In 1718 he defeated the Spanish fleet off Messina. In 1721 B., who had been knighted after the battle of Malaga, was created Viscount Torrington; and on the accession of George II. was appointed First Lord of the Admiralty. He died January 17, 1733.—**John B.**, a British admiral, celebrated for his bravery and misfortunes,

the fourth son of Viscount Torrington, was born in 1704, entered the navy at the age of thirteen, served under his father, and became a captain in 1727. He distinguished himself as a naval officer, and in 1748 was made Admiral of the Red. In 1756 he was sent to relieve Minorca, but failed through inactivity, it was said; and such was the popular indignation, and such the anxiety of the Ministry of the period to divert odium from itself, that he was tried by court-martial, condemned to death, and shot, 14th March 1757. He met his death with great firmness. He was a very brave man, but a somewhat stern disciplinarian.

Bynkershoek, Cornelius Van, a Dutch juriconsult, born at Middelburg, Zealand, 29th May 1673; studied at Franeker, and in 1694 commenced practice as an advocate at the Hague. He was profoundly versed both in Dutch and in international law, and his *Quæstiones Juris Publici* (Leyd. 1737), his *Quæstiones Juris Privati* (left incomplete), and his *Corpus Juris Hollandici et Zelandici*, show complete mastery of the principles and details of every department of jurisprudence. He studied Roman law assiduously, as is seen from his *Observationum Juris Romani Libri IV.* (Leyd. 1710), followed in 1733 by *Observationes Juris Romani*. B. died 16th April 1743. Professor Vicat, of Lausanne, published at Leyden in 1760 (2d. ed. 1766), and at Geneva in 1761, a complete edition of his works in 2 vols. fol.

Byre (a form of *Bower*, q. v.) is the name used in Scotland to denote a house for dairy cows, but also employed in many localities to designate the place where neat and fattening cattle are accommodated. Till within the last dozen years, not half the attention that ought to have been given was bestowed upon the B., and even now (1876) there is great need for improvement. There can be little doubt that not a small proportion of the diseases cattle suffer from are induced and fostered by uncleanly and ill-ventilated byres. The B. should be placed in the immediate neighbourhood of the root and straw stores, so as to avoid unnecessary carriage. Dairy cows should have, if practicable, a stall each, and this should not be less than 4 feet wide—indeed, 5 feet is better. In a single-stalled B. Mr Henry Stephens recommends a width of 18 feet, giving 2 feet for the manger, 8 feet for the length of the cow, a foot for the gutter draining off the fluid refuse, and 7 feet for passage for removal of dung, conveyance of food, &c. Perhaps 20 feet would be preferable, as giving more convenience for dairy cows, although the spaces mentioned are sufficient for feeding cattle. Ventilators should be placed at intervals of every five or six cows, and so arranged in the ceilingless roof as to supply fresh air without causing draughts. Light should come in through windows in the wall behind the cattle. In the case of feeding oxen, two may well stand in a stall together provided it be 9 feet wide, but it is better in all cases to have each animal stalled by itself. Dairy cows do not, as a rule, agree very well with each other, and the consequence is that they sometimes do not yield so much milk as they would do if alone; and in feeding cattle it is frequently noticed that one robs the other of its due share of food. In the best-appointed byres the food is run along in a waggon on rails in front of the cattle. The mangers are best placed about 20 inches in height above the ground, and they should be wide enough to keep long-horned animals from injuring the tops of their horns against the walls. The gutter should drain itself into a liquid-manure tank, and the pavement of the floor should not be carried further than the hind posts, as the stones in front hurt the knees of the animals, and not unfrequently produce permanent swelling. See Stephens's *Book of the Farm*.

Byrgius, Justus, the Latinised form of Jobst Bürgi, a celebrated mechanician, inventor, and astronomer, was born February 28, 1552, at Lichtensteig, in the Swiss canton of St Gall, and died at Cassel in 1633. His celestial globe was a beautiful silver-plated piece of workmanship; and he seems to have invented something like logarithms (*Arithmet. und Geomet. Progress-Tabulen*, Prag. 1620) and the proportional compasses.

Byron, George Gordon, Lord, the greatest poet of the English aristocracy, was born in London, 22d January 1788. His father was a dissipated captain of the Guards; his mother, née Catherine Gordon, a Scottish heiress. Her fortune was speedily wasted, and, separating from her husband (who died at Valenciennes in 1791), she withdrew to Aberdeen, there to bring up her child on a very straitened income. Circumstances, however, were suddenly altered by the death, in 1798,

of the fifth Lord B., when the title and estates lapsed to his grand-nephew, the poet. Mother and son at once left Aberdeen for the family seat, Newstead Abbey, in Notts, and B.'s education was completed at Dulwich and Harrow. While still a Harrow boy, he had his love affair with Miss Chaworth. This was his first *grande passion*; and the lady's rejection of his suit affected him strongly. In 1803, B. entered Trinity College, Cambridge, where he led an irregular life, though always reading widely. In 1807, his youthful work the *Hours of Idleness* appeared; and Brougham's rancorous attack in the *Edinburgh Review* provoked, two years later, the pungent satire *English Bards and Scotch Reviewers*. This work plainly discovered genius; and B. having now achieved some reputation, set out on a Continental tour in 1809. The ripening influence of travel on the poet's nascent genius was displayed in 1812 by the publication of the first two cantos of *Childe Harold*, when, in his own words, 'he awoke one morning and found himself famous.' Next year came *The Giaour*; then the *Bride of Abydos*, the *Corsair*, and *Lara*, all immensely popular. In 1814 he married Miss Milbanke, apparently by way of attempt at self-reform. As such it utterly failed; and, after the birth of one child, Ada, their short and stormy wedded life was ended by Lady B. quitting her husband for ever. To escape this scandal, and the clamour of public opinion, B. left England in 1815, resolving never to return. Change of life gave fresh impulse to his poetic activity. The third canto of *Childe Harold* and *The Prisoner of Chillon* were followed, in 1817, by *Manfred* and *The Lament of Tasso*. These were written at Geneva; while at Venice, in 1818, after completing *Childe Harold*, he composed *Beppo*; and in the next three years wrote the first five cantos of *Don Juan*, and also several dramas. B.'s life was 'now exceedingly profligate; and his *liaison* with Countess Guiccioli led him at last to Pisa in 1821. Here he was engaged on *Don Juan*, *The Deformed Transformed*, the *Vision of Judgment*, &c., till the appeal on behalf of Grecian independence enlisted his ardent sympathy. Leaving Italy in 1823, he reached Missolonghi early in the next year. Dissensions among the patriots damped his zeal, but did not lessen his efforts. Health, however, failed him. Rheumatism and fever were induced by exposure; bleeding might have saved him, but he opposed it till too late. He died at six o'clock on the evening of the 19th of April 1824, amidst the poignant grief of his followers. His remains, carried to England, rest in the family vault of the Byrons in the parish church of Hucknall, near Newstead Abbey.

B. throughout his life was singularly unfortunate. He was so in his youthful training, his physical tendencies, his early attachments, his first literary effort, his marriage, and all his relations with the public. These, more than inherent defects, warped his true nobility of nature. Vanity led him to assume a character: what Matthew Arnold calls his 'Titanism' is often only melodramatic. But society could not see through the Byronic mask, and hence resulted acutest pain to the poet's morbid egotism.

Of B.'s works, *Childe Harold* and *Don Juan* are the greatest; the former more dignified and stately, the latter more vivacious and versatile. They, and the poems similar to them, have a marked feature in their intense realism. B. was a realistic poet; and though Swinburne goes too far in declaring that he had little imagination, yet the criticism is partially just. These poems also possess in common one centre figure—the typical Byronic hero in his varied phases of idiosyncrasy. He is, as it were, an ideal B.; and hence that quasi-identification of the poet's self with his conception, which is a distinctive trait of the Byronic school. This trait injures his dramas; for a dramatist must not be an egotist. His shorter pieces show a rare union of power and tenderness; and this exquisite combination explains the exaggerated praise of Karl Elze, when he pronounces B. 'the greatest lyric poet of England.' B.'s literary, like his personal reputation, has touched both extremes with the ebb and flow of popular favour. This seems the truth—that there are certain states of society, certain natures of men, certain moods of the same man, with which the Byronic spirit will be in finest unison, and that there are others with which it must be discordant; hence the tendency to unduly laud or unduly depreciate. As a poet, he has now reached his fit position; not certainly the first, but yet in the foremost rank of English writers. See *Life, Letters, and Journal of Lord B.* by Moore (2 vols. Lond. 1830); Leigh Hunt's *Lord B. and his Contemporaries* (1828); Medwyn's

Conversations of Lord B. (1824); the Countess Guiccioli's *Recollections of Lord B.* (Lond. 1869); and Trelawny's *Records of Shelley, B., and the Author* (new ed. 1878).

Byron Island, one of the Gilbert Archipelago, in the Pacific, a few degrees S. of the equator, in a direction due N. from New Zealand.—B. Bay, a bay on the N.E. coast of Labrador, N. America, on the S.E. side of Cape Harrison.

Byrsonima, a genus of plants of the natural order *Malpighiaceae*, some species of which have edible fruits. They are, however, very astringent. (See BOIS-TAN.) The bark of various species is used in tanning; and American Alcornque bark, which is imported into Britain for the tanner's use, is said to be derived from *B. laurifolia*, *B. rhopaldefolia*, and *B. coccolobaefolia*.

Byssus, the name applied to the horny or silky filaments formed by the foot (see MOLLUSCA) of certain Lamellibranchiate (q. v.) molluscs, and popularly and collectively known as the 'beard' of these animals. The B. is well seen in the common mussels, which secure themselves to fixed objects by means of these filaments; and in the *Pinna* (q. v.) molluscs, found especially in the Mediterranean Sea, the B. is produced in such quantities that the Neapolitans and Sicilians have long been accustomed to weave a strong durable fabric from it. This fabric is used in the manufacture of stockings, &c. The B. is of very strong nature, and is secreted by means of a groove on the under surface of the mollusc's foot, into which a secretion is poured in a fluid state. This secretion hardens into a thread-like filament, which is drawn out of the groove, and another supply of the secretion being poured into it, a second thread is thus formed; the process being continued until a bunch of filaments is produced.

Byström, Johan Niklas, a Swedish sculptor, born at Filipstad, in the province of Wermeland, 18th December 1783, worked three years under Sergell of Stockholm, applying himself chiefly to the study of the antique, and gained the Academy's prize in 1809. He proceeded to Rome the following year, whence he soon sent home his 'Drunken and Reposing Bacchante.' He returned to Stockholm in 1815, and exhibited his colossal statue of the Prince-Royal, which pleased so well that he was commissioned to execute statues of Karl X., XI., and XII. on the same scale. These were followed later by colossal statues of Karl XIII., Gustavus Adolphus, and Karl XIV. He died at Rome, 13th March 1848. Among his other works are his 'Cupid depriving Bacchus of his Attributes,' 'Nymph going into the Bath,' 'Hercules at the Breast,' 'Apollo at the Lyre,' 'Pandora combing her Hair with a Book in her Hand,' a statue of Linneus, &c. The works of B. are all natural and animated.

By-Town. See OTTAWA.

Byttneriaceae, a natural order of Dicotyledonous plants, the nearest allies of which are *Sterculiaceae*, *Malvaceae*, and *Tiliaceae*. There are about four hundred species, chiefly tropical plants, but some are found in every quarter of the world except Europe. Some are mucilaginous, like their allies the *Malvaceae* and *Sterculiaceae*. *Theobroma Cacao* is the Cacao or Cocoa Tree (q. v.). The fruit of *Guazuma ulmifolia* is eaten for the sake of its sweet mucilage. The young bark yields on maceration a mucilage which is used in Martinique for clarifying sugar, in the same way as is *Kydia calycina* in N. India. The bark of *Microlena spectabilis* of the regions on the S. spur of the Himalaya, *Dombeya spectabilis* of Madagascar, *D. umbellata* of Bourbon, and *Abroma agustum* of various parts of India, yield a fibre used in making cordage.

Byzantine Architecture assumed its distinctive features between the year 328 A.D., when Constantine transferred his court from Rome to Byzantium, and the years 532 and 537 A.D., when the Church of St Sophia was built in that city during the reign of Justinian. This church also marks the climax of the style, it being not only the largest example, but also the one in which the problem of dome construction—its great peculiarity—was most successfully wrought out. Domes had been built previous to this, as in the Pantheon at Rome, but there and in other instances it was merely the roofing-in of a circular drum of solid masonry, while in St Sophia and other B. churches, the dome rests on piers connected together with round arches, thus allowing free access to the other parts of the church grouped

round the dome in the form of a Greek cross. The supporting piers were arranged on plan either in the form of an octagon or a square. The former seems to have been the earliest practice,

Byzantine Capitals at Ravenna.

being the simplest in execution and the least departure from the original Roman method. By the latter the architects gained a complete mastery over the dome, and had fewer obstructions to contend with on their ground plans. They were enabled to do this by corbelling out the space between the connecting arches and the circular dome above. This space was called the 'pendentive'; hence the phrase 'pendentive dome' is applied to all constructed in the B. manner. Certain churches have as many as five domes, as St Mark's at Venice, begun in the year 977, and dedicated at the end of the 11th c. There is a large central dome built as just described, with four smaller ones grouped around, one over each limb of the cross. The Church of St Front, Perigueux, nearly contemporaneous with St Mark, has an almost similar arrangement; and in the same locality there are to be found a great many dome-roofed churches, showing how far W. the influence of B. A. was felt. Several churches along the Rhine, built in the same manner, mark the limits of the style on the N. Notwithstanding those examples, B. A. may be said to be the architecture of the Greek Church, and is chiefly found in Constantinople, Greece, and Asia Minor, in all of which examples are numerous; but with the exceptions of St Sophia and St Mark, all B. churches are of small size. In this style surface ornament is largely used, to the comparative neglect of pure architectural detail, which is further subordinated by the lavish use of gold, variously coloured mosaic-work, and marble slabs let into the masonry.

See *Byzantine Architecture* by Texier and Pullan (Lond. 1864), and Lübke's *Ecclesiastical Art in Germany during the Middle Ages* (Eng. transl. T. C. Jack, Edinb. 1873).

Byzantine Art. Before Constantine publicly made Christianity the religion of the state, the art of the early Christians was a mere adaptation of antique ideas, and practised for the most part in the seclusion of the catacombs; but from the date of that event (324), secrecy being no longer necessary, a new art was gradually developed in Byzantium, which, till the 11th c., exercised a powerful influence on the surrounding nations, and which exists to this day as the art of the Greek Church in Russia. Greek and Oriental artists were employed, and, under their influence and that of antique art, the style arose as perhaps the earliest Christian art distinct from the arts of antiquity. It is characterised by great luxuriance and splendour of material, gold being constantly used for all backgrounds. Mosaic decoration was carried to its utmost—the interiors of many churches being entirely covered by this method. St Mark's in Venice alone contains upwards of 40,000 sq. feet of mosaic, executed in the most gorgeous and costly manner.

After the Iconoclast war in the 8th c., the style began to assume a stereotyped character, in obedience to the strict limits proscribed by the Church to prevent idolatry; and so little was freedom of thought allowed, that the monks of Mount Athos were found practising the art, in 1839, in exactly the same manner as laid down by the Church in the 10th c. As might

be expected, sculpture was not in much esteem, the specimens remaining being few and unimportant.

See Owen Jones's *Grammar of Ornament*, and Wyatt & Waring's *Handbook to Byzantine Court, Sydenham*.

Byzantine, Greek, or Eastern Empire, The, was founded in the 4th c. by Theodosius the Great, who divided the Roman Empire into the E. and the W.; the former including Bulgaria, Thrace, Macedon, Greece, Crete, Asia Minor, Syria, and Egypt. To this Arcadius succeeded on the death of his father in A.D. 395. Rufinus, Prefect of the E., carried on the government by a fiscal oppression and administrative corruption, continued (after the murder of Rufinus by the soldiers of Stilicho) by the eunuch Eutropius, who in 397 passed the law of implied treason, and secured the appointment of Alaric (q. v.) as Master-General of E. Illyricum. After the Ostrogothic rebellion of 399, Eutropius was succeeded by the Arian Goth, Gainas, who gave place to the Empress Eudoxia, the persecutor of Joannes Chrysostom (q. v.). In 408 Arcadius died; till 415 the prefect Anthemius (who repelled the Huns) acted as protector of Theodosius II., who resigned the empire to his sister Pulcheria. Theodosius married the learned Eudocia (Athenais). The war with Persia, securing a readjustment of Armenian territory, the cession of W. Illyria by Valentinian III., the 'cruel and ignominious' treaty with Attila (q. v.) in 446, were followed by the death of Theodosius in 450, and the marriage of Pulcheria with the senator Marcian, who maintained the concessions obtained by Maximin from the Huns. In 457 Leo I., a Thracian military tribune, was placed on the throne by Aspar, the patrician heretic, father of the general Ardaburius. Leo assisted Anthemius against the Vandals. He was crowned by the Patriarch of Constantinople. After a few months' rule of Leo II., his father, Zeno (Trascalisseus), succeeded, and partly by the aid of Theodoric the Ostrogoth, whom he bribed and afterwards encouraged to attack Odoacer in the W., he suppressed the revolt of Verina and Basiliscus. From 491 to 518 Anastasius I. occupied the throne. His reign was troubled by Bulgarian and Persian wars. He built the long wall.

Justin the Elder, an illiterate but successful soldier, who became emperor at the age of sixty-eight, punished the Nestorian and Eutychian heretics with severity, and in 527 resigned in favour of his nephew Justinian (q. v.), who married Theodora. The brilliant campaigns of Belisarius (q. v.) and Narses (q. v.) in the African, Italian, Persian, and Colchian wars, and the consolidation of the civil law by Tribonian and his colleagues, did not make Justinian's empire secure. The capital was torn by the faction fights of the Greens (Prasini) or Anastasian party and the Blues (Veneti) or orthodox party, to which the Emperor belonged. The terrible insurrection called Nika is said to have cost 30,000 lives. Unjust laws, the oppressive *anona*; the sale of offices, and the starvation of the army, spread discontent; and the appearance of the Lombards and the Avars rendered the N. frontier still more insecure. In 565 Justin II. succeeded. His weakness made his wife Sophia virtually supreme, and in 574 Tiberius, Captain of the Guard, was made Regent, and became Emperor in 578. After suppressing the conspiracy of Sophia and Justinian, Tiberius, who assumed the name of Constantine, made advantageous treaties with the Persians and the Avars, and in 582 chose as his successor Maurice, the Commander of the Legion of 12,000 Confederates. The latter continued the economical policy of Tiberius II., to the great discontent of the army; the inroads of the Avars prevented him from succouring the imperial cause in Italy against the Lombards, but in a successful Median campaign he defeated the usurper Bahram, and restored Chosroes to the throne of the Sassanids. Phocas, the centurion, succeeded in 602, Maurice falling a victim to faction-fury. The former was a monster of cruelty and ignorance, and in 610 Heraclius, the Exarch of Africa, who had never acknowledged the usurper, approached the capital with a small fleet, and on the murder of Phocas, was at once chosen emperor. He succeeded to the Persian war, which Chosroes, the conqueror of Syria and Egypt, had declared against Phocas, and in which the veteran Narses had refused to serve the empire. After seeing both Avars and Persians almost at his gates, Heraclius, borrowing largely from the Church, began in 622 the famous Six Campaigns, which by the careful drill of the troops and the religious enthusiasm inspired by the bravery and devotion of the Emperor, partly also by

Turkish aid, resulted in the overthrow of the Persian and of the Avar power, the evacuation by the Persians of Syria and Egypt, and the restitution of the true cross to the Holy Sepulchre. These territories were, however, at once seized again by the Arabs. Heraclius died in 641, and was succeeded by his son Constantine III., who reigned 103 days. The conspiracy of Martina and Heracleonas having been suppressed, Constans II., the son of Constantine, became emperor. He murdered his brother Theodosius, and retired to Syracuse, where he was himself murdered in 668, and succeeded by his son Constantine IV. (Pogonatus), in whose reign the Sixth General Synod of Constantinople was held. He defeated the Arabs, who were at this time under the rule of the Omniades, but was forced to pay tribute to the Bulgarians. From 685 his son Justinian II. (the destroyer of St. Maron's Monastery) ruled till 695, when the conspiracy of Leontius banished him to the Crimea. In 705 he was restored by the aid of the Bulgarians, but his cruelties excited a revolt, and in 711 he and his son Tiberius, the last of the Heraclian line, were assassinated.

The Isaurian Dynasty and its sequel.—The short and troubled reigns of Philippicus (Bardanes), Anastasius II., and Theodosius III., all elected sovereigns, led to the choice of Leo III., the Isaurian (from a district in Pisidia), who begins the Iconoclast Period (717 to 867). By some this is regarded as the true beginning of the Byzantine, as distinguished from E. Roman, Empire. Leo, by his defence of the capital against Moslemah and his defeat of Sid-al-battal, restored the imperial authority in Syria. He also reorganised the Themes, or provinces, over which he appointed Strategoi, and pursued a policy of centralisation even in the Church, in which he opposed images and pictures. His opposition to the Popes, Gregory II. and III., and the severity of his taxes, favoured the independence of the Italian dukes. He was the last of the B. emperors who confirmed a papal election. His son Constantine V. (Coprnomus) succeeded on the death of Leo in 741. After a struggle with his brother-in-law, Artavasdos, he secured his 'Romanian' frontier against the Saracens, carried on a successful aggressive war against the Bulgarians, suppressed the Skamars or outlaws, and extended to crucifixes the iconoclasm of his father. Leo IV., the Khazar (775-780), succeeded his father Constantine, and was himself succeeded by his son, Constantine VI., during whose reign the Empress-mother Irene obtained from the second Council of Nicaea the emphatic approval of 'reverence' for images. In 797 Irene, partly through the influence of the monks, dethroned her son, and retained power until 802; she desired a marriage with Charlemagne, who had been proclaimed Emperor of the W. In 802 Nicephorus, the Grand Treasurer, became emperor through a conspiracy. He arranged by treaty the division of Italy with Charlemagne, continued the unfortunate defence against Harun Al Rashid's mercenary incursions, and in 811 was killed in battle with the Bulgarians, who, as well as the Slavonic settlements S. of the Danube, were constantly troubling the empire. The reigns of Stauralos and Michael I. are unimportant. The cowardice of the latter in camp led to the elevation of Leo V. (the Armenian), General of the Anatolic Theme, who crushed the Bulgarian leader Crumu at Mescuria, adopted the 'Chameleon' or Toleration policy in the image question (which, however, was finally decided in favour of the military Iconoclastic party), purified the administration of justice, and was assassinated in 820. His assassin, Michael II. (the Stammerer), the founder of the Amorion dynasty, ruled till 829, in which period the empire lost Crete to the Spanish Arabs of Abou Hafs, and Sicily to the Aglabites, and suffered from a civil war begun by the rebel soldier Thomas. Michael persuaded the W. Church under Louis le Débonnaire to condemn images, as Charlemagne had previously done in the Caroline Books. His son Theophilus (829-842) owed much of his domestic policy to Patriarch Joannes, the Grammarian. The skill of his general, Manuel, could not avert the triumph of the Calif Motassem at Amorium. Under the regency of Theodora, a new Council of Nicaea restored image-worship (an event still celebrated in the Greek Church), and the persecution of the Paulicians produced a revolt.

The Macedonian Dynasty.—The disgraceful character of Michael III., and his uncle Bardas, who ruled down to 867, are a little relieved by the vigour of Photius, the Patriarch, who first threw off the authority of the Pope. They were succeeded by the chamberlain Basil I., the Macedonian, founder of the

Basilian dynasty, which endured till 1057, the period of greatest power and glory in the B. Empire. Basil's reign is marked by the publication of the Procheiron and the Revision, completed by the Basilike of Leo VI., codes of the Roman law as applied at Byzantium, which favoured the union of legislative, executive, judicial, and administrative power in the Emperor. Basil established the Theme of Longobardia in Italy, but his frontier in Cilicia was constantly harassed by Saracens and Paulicians. On his death in 886, Leo VI., the pedantic author of a work on military tactics, and the publisher of the 'Novels,' succeeded. His defeat at Crete, and the storming of Thessalonica by the Mohammedans, show unusual military weakness. His legitimated son Constantine VII., Porphyrogenitus, reigned feebly, first under the regency of Alexander, and with an interval of Romanus I. (920-944), but his leisure was employed on valuable historical works. His son, Romanus II., ascended the throne in 959. Affairs were conducted by Bringas, the minister, and Nicephorus II., Phokas, who was victorious in Crete, and who assumed the purple in 963. He recovered Antioch from the Saracens, but was drawn into hostilities with the Emperor Otho in Italy, and with the Hungarians and Russians. He was in 969 assassinated by John I. (Zimjskes), who married Theophania, his predecessor's widow, and ruled till 976, inflicting a severe defeat on the Russian Swiatoslaw at Durystolon, which quieted Bulgaria for some time. This advantage was extended by Basil II. (976-1025) expressively called Bulgaroktonos, the son of Romanus, who, after quelling the aristocratic insurrection of the two Bardas, conquered the new Bulgaro-Slavonic kingdom, which had been founded by the Bulgarian Samuel, and was assisted by the Wallachian Ladislav. Basil's Armenian and Aleppo campaigns were also successful. His brother, Constantine VIII. (1025-28), was incapable, and the government was conducted by eunuchs. The next four emperors, Romanus III. (1028-34), Michael IV. the Paphlagonian (1034-41), Michael V. (Kalaphates or the Caulker, 1042), and Constantine IX., Monomachus (1042-54), were all successively husbands of Zoe, the daughter of Constantine VIII. The fiscal oppressions of Joannes, the Orphanotrophos, the revolt of Servia under Stephen Bogislav, the brilliant but unavailing campaigns of Maniakes against the Saracens in Sicily and the Normans in Italy, the Russo-Varangian invasion of Vladimir, the conquest of the Armenian kingdom of the Bagratians, followed by the attacks of the Seljuk, Toghrul Beg, on that territory, and the final rupture of the Greek and Latin Churches, are the chief events of this period.

The Comnenian Dynasty.—The short reigns of Theodora (sister of Zoe) and Michael VI. (wrongly called Stratiotikos) gave place to the Paphlagonian, Isaac I. (Comnenus), who, after meeting an invasion of the Hungarians, retired to the monastery of Stucion, resigning the throne to Constantine X. (1059-67), in whose reign Alp Arslan conquered Armenia and Iberia without Byzantine resistance. Constantine's widow, Eudocia, married Romanus IV. (Diogenes), who proved unequal to the task of defending Cappadocia against the Seljuks. In his reign, also, Guiscard the Norman captured the last imperial city in Italy (Bari). Michael VII., Parapinakes (1071-78), appointed Suleiman, an officer of Malekshah, governor over the territory of Roum, and thus made an important concession to Seljuk power. The reign of Nicephorus III. was broken by frequent rebellions, and at last Alexius I., Comnenus, whose mercenaries had sacked the capital, obtained the throne in 1081. His dynasty endured till 1185. His reign is marked by the Norman invasion of Illyria, the Patzinak war in Bulgaria, the First Crusade, and the gradual advance of the Seljuk power in Asia Minor. Joannes II., the Good (1118-43), was a successful soldier, but his son, Manuel I. (1143-80) disintegrated the imperial army, and suffered in consequence serious reverses in Phrygia. Court intrigues are supreme during the reigns of Alexius II. and Andronicus I. (1180-85). The murder of the latter ends the Comnenian dynasty. In Isaac II. (Angelos) and Alexius III., Angelos Comnenus (1185-1203), we see the rapid declension of the empire answering the rise of the Wallachian-Bulgarian kingdom.

The Latin Interregnum.—In 1203, on the suggestion of the German Emperor, and having received permission from Pope Innocent III. to plunder the E. Empire, the Doge Enrico Dandolo stormed Constantinople and reinstated Isaac II., with his son Alexius III. as colleague. The usurpation of Alexius V. (Murtzuphlos) was immediately followed by the

taking of the capital by the Venetians and Crusaders, after which, in accordance with treaty arrangements, Baldwin of Flanders became Emperor of Roumania, the Venetians obtaining territories on the Adriatic and Ægean coasts, and much of the Greek Empire being split up into principalities and dukedoms. The Belgian or Latin dynasty of Baldwin (including Henri, his brother, Robert of Courtenay, Jean III. of Brienne, the titular King of Jerusalem, and Baldwin II. endured till 1261, but was wholly unable to maintain the empire against the Rhodians and Epirotes on the one hand, and the Greek Empire of Nicæa on the other. This Greek Empire was established by Theodore I., Lascaris, and strengthened by Joannes III., Vatatzes, who reigned 1222-54, allied himself with the Bulgarians, and received the submission of the pretended Emperor of Thessalonica.

The Dynasty of the Palæologi.—The short reigns of Theodore II. (1254-58) and Joannes IV. were succeeded by the able but unscrupulous Michael VIII., who, helped by the Genoese, captured Constantinople in 1261, and founded the dynasty of Palæologus, which endured till the final overthrow of the Eastern Empire in 1453. In 1204 a third empire had been established by Alexius Comnenus in Pontus and Paphlagonia, the capital being Trebizond. Under Michael, who reigned till 1282, the rebellion of the Nicæan Greeks prepared the way for the Turks. Charles of Anjou threatened the empire on the W., and Michael became unpopular by his high-handed negotiation of the union of Greek and Latin Churches, which took place at Lyons in 1274. In the following reign of Andronicus II. (1282-1328), the empire suffered chiefly from the Catalan Grand Company, who had originally been hired to resist Othman the Turk. The Libertine, Andronicus III. (1328-41), was unable to prevent the Turks occupying Nicæa and Nicomedia, and even ravaging Thrace and Macedonia. The reign of his son, Joannes V. (1341-91), including the regency of Anne of Savoy, the civil war and reign of Joannes Cantacuzenos, and the intervals of power of Andronicus, reduced the empire to the vassalage of the Sultan Murad I., who made Adrianople his capital (1361). Manuel II., the son of Joannes (1391-1425), sunk still deeper into dependence on Bayezid I., the victor of Nikopolis, and was left by Murad II. (who defeated the Hungarians at Varna) in possession of the capital, a few towns in the neighbourhood, Thessalonica, and a part of the Peloponnesus. The extreme weakness of Joannes VI. (1425-48) induced him at the Council of Florence (1439) to agree to the union of the Churches in the hope of military assistance which was not sent. His brother, Constantine XI. ('the last of the Palæologi'), fell in the final siege of Constantinople, which, along with Justiniani, he bravely but vainly defended against Mohammed II. (1453). The empire of Trebizond and the independent despots of Greece soon after submitted. So ended 'the premature and perpetual decay' of the B. Empire. See Finlay's *Hist. of B. and Greek Empires*, which also contains a description of the system of government by a privy council without senate; of the domestics of the palace; and of the provincial and military government. These form the subjects of the two works of Porphyrogenitus, *De Ceremoniis*, and *De Thematibus*.

Byzantine Historians may be divided into three classes:—

1. *General Historians*, who begin either with the Creation or the Christian era, but deal more in detail with B. history, such as Georgius Cedrenus; a monk of the 11th c., compiler of *The Chronicle Paschale*, or *Alexandrian Chronicle*, coming down to 1042 (edited by Ducange); and Michael Glypas, author of a *Chronicle* coming down to 1118.

2. *Special Historians*, who confine themselves to B. history,

or periods thereof, such as Nicolas Chalcondylas of Athens, whose history reaches the year 1462; Agathias, the poet, whose account of Justinian's reign from 553-559 is extremely sober and valuable; Anna Comnena, and Joannes Cinnamus, imperial notary, who have left accounts of most of the 12th c.; Joannes Cantacuzenos, who after abdicating wrote a B. history from 1320 to 1357; and Georgius Phranza, the historian of the Palæologi, from 1260 to 1477.* The history by Michael Pællus, the Prince of Philosophers, has been edited this year (1875) by M. Sathas.

3. *The Writers on Social Institutions*, &c., such as Prosopius, whose book, *De Edificiis*, refers to Justinian's time (he also wrote two contemporary histories); Joannes Laurentius, who describes the Roman magistrates of the same period; and the Emperor Manuel Palæologus, who left several works of interest. The Paris edition of 1645-1711, and the Venice edition of 1729, are both praised by Gibbon. But that begun by Niebuhr in 1828, and carried on by Bekker and others, is the most complete. Ducange has published valuable supplementary works—e.g., *The Greek Glossary*. See Schoell, *History of Greek Literature*.

Byzantines are the gold, silver, and copper coins struck by the various emperors of the East. Of these the chief are *nomisma* or *solidus* in gold, the *millaresion* and *keration* in silver, and five small copper coins, mounting in value, as 5, 10, 20, 30, 40. Since Justinian I., these coins contain the date of the reign, a letter showing where struck, generally a head of the sovereign, with some symbol, as a sword, &c., and the name of the sovereign and consort, or colleague. They sometimes indicate how far a usurper obtained authority. The *surfrappe*, where one head is struck over another, is especially valuable in chronology. The emperors frequently got rid of their debts by debasing the currency, and gave bad change to the Crusaders. This reached its climax in Andronicus II., who issued the byzant half gold and half alloy. The byzant was divided into *seminis*, *trimenis*, and *tetartem*, all gold. Finlay says that B. gold was in circulation from Scandinavia to India. The chief reformer of the currency was Anastasius I. The chief writers on these coins have been Ducange, Bon Marchant, Pinder and Friedland, and De Saulcy. It is noteworthy that Mahomet II. struck a coin at Constantinople, in which he calls himself 'King of all Greece and Anatolia.'

Byzan'tium was founded by the Megarians in 667 B.C. Its splendid and secure position on the Thracian Bosphorus gave it the command of the sea, and of the shores of Europe and Asia, and it speedily enjoyed great commercial prosperity. B. was for some time subject to Darius Hystaspes, from whom it was freed by Pausanias. In 408 it was taken by Alcibiades, but was recaptured in 405 by Lysander. In 390 Thrasybulus changed the government from an oligarchy into a democracy. In 356 B. again attempted to throw off the Athenian yoke, but in 340 gladly received the aid from Athens that enabled it to check the career of Philip. After much oppression by the Gauls, it became subject to Rome. In the civil war between Severus and Pescennius Niger (2d c. A.D.), B. was taken by Severus, and destroyed. He subsequently, however, rebuilt and embellished a portion of it; and when Constantine removed hither the seat of empire from the Tiber, under the name first of New Rome and afterwards of Constantinople, it became for a time the most august city on the earth.

* The works of the Emperor Constantine VII. (*Porphyrogenitus*, circa 950-1050) should also be mentioned.

C.

is a letter first appearing in the Latin alphabet, from which it passed to all the alphabets derived from the Latin. Its place corresponds to, and its sound or 'power' was originally the same as, that of the Phœnician and Greek *g*, as in *gold*. Not only do ancient inscriptions prove this, as when the beaked column in the Forum uses *macistratus*, *leciones*, *Cartaginiensi*, &c., for the later forms *magistratus*, *legiones*, *Carthaginiensis*; but more than one Latin author distinctly asserts it. It may be regarded as additional evidence that words like *Caius* and *Cneius* were written in Greek *Gaios*, *Gnaios*. At a very early period—the precise date is not known, but it was at least as early as the time of the kings—C lost its flat, guttural sound of *g*, and acquired that of the sharp, guttural *k*, which it continued to possess down to the 8th c. A.D. This was its sound before every vowel, and Romans not only pronounced the *c* in *casa* and *comes* as a *k*, but also in *Cicero* and *Cæsar*, as one may see from the Greek equivalents *Kikêrôn* and *Kaisar*. The modern German *Kaiser* also preserves a recollection of the fact. So long as Latin was spoken with any degree of care, the original 'power' of C probably continued unimpaired, but when the schools were closed, and the barbarians began to rudely use the language of the empire they had overthrown, change was inevitable, more especially as certain consonants before certain vowels betray a natural tendency to lose their distinct character. Thus C in *facio* yields, in the form of *fakyo*, a slight sibilant sound, so does *t* in *natio*, and *d* in *diurnalis*. If the tendency be allowed to go on unchecked, it will develop itself more and more, until *fakyo* will become *fashio* or *fassio*, *natio*, *nashio* or *nassio*, and *diurnal*, *journal*. Hence the modern pronunciation of C as *sh* or *s* before *i* and *e*. The same process (though the historical circumstances are quite different) offers a satisfactory explanation of the change in the pronunciation of C in our own tongue. In Old English it had the power of *k*; in later and modern English it is often *tsh*. Thus *ceap* (kyap), *ceorl* (kyorl), *ceosan* (kyosan), *cyr* (kyr), and *cyrc* (kirke), have become *cheap*, *churl*, *choose*, *char*, *church*. Romance influence has obviously been at work here, but the tendency is already seen in the Old English itself, in the difference between the *ceorl* of our forefathers and the harder *karl* of the Germans, and was in all likelihood only hastened by the ruin that befell the mother-tongue after the Norman Conquest. As a letter, C may be considered superfluous. It represents nothing that is not represented by *k* or *s*; but its existence is part of history, and therefore not lightly to be dispensed with. For a notice of the various changes which it undergoes, see FRENCH LANGUAGE AND LITERATURE, and ROMANCE LANGUAGES AND LITERATURE.

C, in music, the name of one of the notes of the gamut, the major scale of which is given by the white keys on the piano-forte. If we suppose the inaudibly low note which corresponds to one vibration per second to be a C, the middle C of the piano will make 256 vibrations in the same time, and there are many reasons for fixing upon this as the standard pitch; but the pitch commonly used here in concerts corresponds to a middle C vibrating 263 times per second.

Ca'ing Whale (*Globiocephalus*, or *Phocæna globiceps*), a species of *Cetacea*, included in the family *Delphinida*, and forming the type of the genus *Globiocephalus*, but at other times regarded as forming a mere species of the Porpoise genus (*Phocæna*). This animal—not a true whale, zoologically considered—is occasionally known as the 'Round-headed Porpoise,' and

as the 'Bottlenose Whale.' It frequently occurs off the Orkney and Shetland Islands, and may attain a length of from 15 to 24 feet. These animals are gregarious in habits, and afford an oil, for which they are hunted. The head is very convex and rounded, as also is the muzzle. The body is thickened, the tail being forked. A single dorsal fin exists. The forelimbs, existing in the form of fins, are elongated and narrow. The general colour is black, the under surface of the body being streaked white. The skin is smooth, and destitute of hairs. The food consists of fishes, cuttlefishes, and similar organisms. When one of these forms runs ashore, the whole herd generally follows, and large numbers are sometimes thus captured—their name 'ca'ing,' or 'driving,' being derived from this circumstance. 1110 of these whales were captured in 1809 at Hvalfjord, in Iceland.

Cabal', a word supposed by some to be the same as the Hebrew *Cabbala* (q. v.), and therefore meaning a secret teaching known only to the initiated, but this derivation is more than doubtful. Its proper application is to a small party secretly united to attain its ends by faction or intrigue. The Cabinet of Charles II., in 1671, known as the C., was composed of five persons, the initial letters of whose names, by a whimsical coincidence, says Macaulay, 'made up the word C.: Clifford, Arlington, Buckingham, Ashley, and Lauderdale.'

Cab'ala, Cabb'ala, or Kabbala (Heb. 'that which has been received'), according to the Jewish account, was the mystical interpretation of Scripture which was received from God by Adam, Abraham, and Moses, and handed down through Joshua to the seventy elders and their rabbinical successors. Of the C. in this sense there are three kinds: 1. *Gematria*, by which a meaning is found for words by taking other words whose letters, according to the numerical value of the (Heb.) alphabet, amount to the same number. Thus the letters of 'Shiloh shall come' and of 'Messiah' both represent 358, therefore Shiloh means Messiah. 2. *Themura*, by which the first letter of the alphabet was exchanged for the last, the second for the second last, and so on. Thus, 'In the beginning' becomes 'the first of Tisri,' therefore the world was created on that day. 3. *Notarikon*, by which a word is made to indicate a number of words, of which words its letters are the initials. Thus the letters of Ad(a)m form the initials of Adam, David, and Messiah; therefore the soul of Adam became David's, and then the Messiah's. The C. is divided into two branches—*Mercaba* (chariot, Ezek. i.), which treats of the perfections of God and the celestial intelligence; and *Bereshith* (in the beginning, Gen. i. 1), which treats of the material universe. The most important of the cabalistic writings are the *Sepher Yetzira* (Book of the Creation), and *Sepher Zohai* (Book of Splendour), written probably by R. Akiba and R. Simeon Ben Jochai respectively. See Gardner's *Faiths of the World*.

Caballe'ro, Fernan, is the *nom de plume* of Cecilia Böhl von Faber, the daughter of a German merchant, who died at Cadiz in 1836. She was born, during a visit of her parents to Switzerland, at Morget in 1797, was educated in Germany, returned to Spain in 1813, and has had a somewhat chequered career. She has been thrice married, and, although inheriting literary tastes from her Spanish mother, who was an authoress of note, only commenced her career as a writer in 1849, at the mature age of fifty-three. It is scarcely less remarkable that one who began so late should have almost at once attained a foremost place in the works of Spanish novelists. In keen perception of the peculiarities of the national life, in genuine national feeling, in originality of treatment, and in a fine idyllic grace of

description, she is unsurpassed. Her first work was *Gaviola* (1849). It was followed by *Elia*, *Clemencia*, *La Familia de Alvarada*, *Cuadros de Costumbreros Populares Andaluces*, and many others. She has published a collected edition of her works (*Obras Completas*) in 17 vols. (Mad. 1860-66). She died 7th April 1877.

Cabanel, Alexandre, a French painter, born at Montpellier, 28th September 1823. He travelled to Rome, and gained prizes at Paris in 1845, 1852, and 1855. Among his works are 'The Agony of Christ in the Garden of Olives,' 'The Death of Moses,' 'The Christian Martyr,' 'Othello relating his Battles,' 'Michael Angelo,' 'Aglaia,' 'Velleda,' and a series of designs representing the twelve months of the year, 'The Birth of Venus,' and 'Adam and Eve.' He was made a member of the Académie des Beaux Arts in 1863, and an officer of the Legion of Honour in 1864.

Cabanis, Pierre Jean Georges, born at Cónac, near Brives, 5th June 1757. After a stay at Warsaw in a situation as private secretary, he settled down as literary man and medical man in Paris, where he had studied. A moderate reformer, he was the friend of De Tracy and Mirabeau, the latter of whom he attended on his deathbed: he acted successively in the Council of Five Hundred and the Senate, and was finally made Director of the Paris Hospitals. He died 6th May 1808. His great work, *Rapports (Traité) du Physique et du Moral de l'Homme*, originally read as Mémoires before the Institute in 1798-99, was published in 1802 (new ed. 1855). Declining to recognise an essential difference between life and mind, and dissatisfied with the meagre theory of Condillac, C. sets himself to show 'how sensations are modified by modifications in the organs; how ideas, instincts, passions, are developed and modified by the influences of age, sex, temperament, maladies.' His attempts to analyse certain instincts were crude, but he is not guilty of the absurdity that 'thought is a secretion of the brain.' He merely meant that thought was a function of the brain. C.'s *Œuvres* were published at Paris in 5 vols. (1823-25).

Cabatuan, a town in the island of Panay, Philippines, Malaysia, on the Tiguan, has considerable trade in rice, cocoa-nut oil, wax, and ebony. It was founded in 1732, but its situation is unfortunate. The river, which is at times scarcely navigable, swarms with crocodiles. Pop. 23,000.

Cabazera, a town in the island of Luzon, Philippines, Malaysia, has some manufacture of tobacco. It is capital of the province of Cagayan. Pop. 15,000.

Cabbage (*Brassica oleracea*), a plant used for culinary purposes, and for feeding cattle, extensively cultivated in this country and in nearly every temperate region of the globe. It is found wild on the rocky shores of Britain, and the S. of Europe generally, but in a very stunted condition. Kale or Greens—*Boracole*, *Colswort*, *Savoy*, *Kohl Rabi*, *Cauliflower*, and *Broccoli* (all of which see)—are some of the best known varieties into which it will 'sport' under cultivation. The *Common* or *White C.* is the variety most used for the table, while the *Red C.* is used for pickling. In the Channel Islands and the N. of France the *Tree* or *Cow C.* is cultivated for feeding cattle. It has a branching stem, and will reach a height of 10 feet. The *Portugal* or *Tranzuda C.*, or as it is also sometimes called, the *Couve Tromchuda*, is a delicate variety, with large midribs, which are sometimes used as a substitute for sea-kale. In cultivation the C. requires a rich soil, well manured, and frequently disturbed about the roots. By sowing at different seasons a succession can be had throughout the summer. It is not a very nutritious vegetable, containing about 90 per cent. of water. The raw C. is more digestible than the boiled—the first taking two and a half hours (or with vinegar, two hours), the other four and a half hours to digest. See SAUER-KRAUT.

Cabbage Bark. See ANDIRA.

Cabbage Butterfly, a genus of butterflies, so named from their larvæ or caterpillars feeding on the leaves of cabbages and other plants of the natural order *Crucifera*. The large white C. B. (*Pontia Brassicae*) is a familiar tenant of our gardens in summer, and is known by its white wings, which are spotted and

fringed with black. The wings may attain an extent when expanded of from 2 to 3 inches. The eggs, of a yellow colour, are deposited in numbers on cabbages, &c., and the caterpillars average from 1 to 1½ inches in length. They suspend themselves by a silky thread from walls, and are thus transformed into pupæ, from which during the same summer, or in the ensuing spring, the perfect insects appear. The small white C. B. or turnip butterfly (*P. Rapæ*) is of smaller size than the preceding form; its caterpillars boring into the hearts of vegetables, and being coloured pale green with a yellow dorsal line, and an interrupted yellow line along each side; while the pupa or chrysalis is reddish brown speckled with black. The green-veined white butterfly (*Pontia Napi*) closely resembles the latter species in appearance.

Cabbage Butterfly.

Cabbage Fly (*Anthomyia Brassicae*), a species of the Diptera or Fly order of insects, the larvæ of which burrow in cabbage and turnip roots. Nearly allied to this form, and included in the same genus with it, are flies of similar habits—such as the Turnip Fly (q. v.), Beet Fly (q. v.), &c. The C. F. is grey coloured, the face being silvery grey, whilst the males have a black line or mark on the forehead. The male abdomen is of narrow similar diameter throughout; that of the female being conical in conformation. The male averages ¼ of an inch in length, and the wings about ½ an inch in extent. The pupa is reddish coloured.

Cabbage Moth (*Noctua Brassicae*). The larvæ of this moth feed on the leaves of cabbage and turnip plants. These moths belong to the tribe *Noctuina* (*Lepidoptera*), the members of which are nocturnal in habits; the caterpillars being naked, and provided with sixteen feet, whilst the pupæ are enclosed in a loose cocoon. The moth is of a general rich brown colour.

Cabbage Palm, or **Cabbage-Tree**, a name given to the terminal bud of different species of palm, which is eaten like a cabbage. Thus the C. P. of the W. Indies is *Areca oleracea*, that of the Southern United States is the Palmetto (*Chamærops Palmetto*), while the Australian C.-T. is *Corypha australis*, the leaves of which are made into plait for hats, baskets, &c. The name C.-T. is also applied by gardeners to *Kleinia nerifolia*.

Cabbage Wood. See ERIODENDRON ANFRACTUOSUM.

Cabei'ri, certain mysterious deities worshipped as tutelary genii in Lemnos, Samothrace, and other localities in Greece. The service (*Cabeiria*), with its mysteries, festivals, and orgies, was found also in Egypt, Phœnicia, and Asia Minor. The C. were represented as dwarfs, and being adepts in metallurgy, they were called the sons of Hephestos. The origin and progress of this worship has been investigated by Lobeck (*Aglaopham.*, pp. 1202-81), but the subject is involved in great obscurity, as those who took part in the mysteries were strictly prohibited from divulging them.

Ca'bes, or **Khabs**, Gulf of (the *Syrtis Minor* of the ancients), a broad and deep inlet of the Mediterranean Sea, on the coast of Tunis, N. Africa. The reports of the ancients as to the cloud-like masses of sand, raised on its shores by the wind, which often overwhelmed men and even ships, have been confirmed by modern travellers.

Cab'et, Etienne, a French writer on communism, was born at Dijon, January 2, 1788. He began political life as a Carbonarist, and in 1833 started in Paris a Radical paper, *Le Populaire*. An article in this journal caused him to be sentenced to imprisonment for two years. C. fled to London, where he continued his journal, and developed into a pure communist. As such, he published numerous articles, pamphlets, and books, including a *Histoire (prétendue) de la Révolution de 1830*. The most remarkable of these communistic works was the *Voyage en Icarie* (1840, 5th ed. 1842), a Utopian romance, which was so popular among the working classes of Paris that C. obtained a considerable following, and was able to send out an 'Icarian

colony' to Texas in 1848. This experiment failed; but, nothing daunted, he went out to the United States with a second division of colonists, and established himself at Nauvoo, in Illinois, from which the Mormons had been expelled, in 1850. There he ruled as a sort of doctrinaire-dictator till 1856, when he was removed by a revolution, and had to flee to St Louis, where he died, 9th November of the same year.

Cabe'sa del Buey ('Ox-head'), a town of Spain, province of Badajoz, 57 miles N.N.W. of Cordova by railway; has some trade in woollen and cotton goods, corn, and cattle. Pop. 5400.

Cabeza del Negro ('Negrohead'), the Columbian name for the front of *Phytelphas macrocarpa*, the hard alburnum (or endosperm) of which constitutes 'vegetable ivory.'

Cabezón de la Sal, a town in the province of Valladolid, Spain, lies on the Pisuerga, 7 miles N.N.E. of Valladolid, and is notable for an early action (1808) of the Peninsular war, in which the French gained an easy victory over the Spaniards.

Cab'in (Fr. *cabane*, from Low. Lat. *capanna*, 'a small cot'), the nautical term for a room or apartment. In ships of war, the cabins of the officers below the captain, and the 'state-cabins' of the admirals and captains, are enclosed by a light panelling, which is removed when the ships are preparing for action.

Cabinet (Fr. *cabinet*, 'a chamber'), literally a diminutive of Cabin (q. v.), but of much wider signification, is applied, among many other meanings, to a room in which pictures, statuary, articles of *virtu*, antiquarian specimens, natural curiosities, models, and other treasures are kept. The term is also applied, both in France and this country, to the collections themselves which are exhibited in a C., or even in a gallery or galleries. The phrase, *C. picture*, means a small work of art so carefully finished in all its details as to successfully endure minute examination.

Cabinet. See MINISTRY.

Cable (Low. Lat. *caplum*, from *capulum*, 'a cord or halter'), a large rope chiefly used for the anchors of ships. It is generally made of hemp twisted in such a way (see ROPE) that it has no tendency to unwind itself. The standard length of a C. is 120 fathoms, and its size is generally given by stating its circumference, which varies from 3 inches to 2 feet. The direct pull which will break a 10-inch cable is about 28 tons; for other sizes it varies as the square of the circumference. The enormous cables which at one time were used for large vessels are now to a great extent superseded by chains or chain-cables, which can be much more conveniently handled, and possess other advantages. They consist of oval welded links of wrought iron, each link being generally fitted with a little cross-piece or stud to prevent its sides being drawn together by the pull upon it. A stud chain has rather more than three-quarters of the tensile strength possessed before working by the iron of which it is made; an unstudded chain only about half of the original strength.

C. is also the technical name of the metallic core surrounded by insulating material, now of such importance in oceanic telegraphy. See TELEGRAPH, SUBMARINE.

Cable-Moulding, in architecture, a feature of the later Norman style, consisting of the carving of a rope with the twisting prominent.

Cabling, a feature of classical architecture, seen in the moulding by which the hollow parts in the flutes of columns and pilasters are partially filled.

Caboché, or **Cabossed** (Old Fr. *caboché*, a diminutive of Lat. *caput*, 'the head'), in heraldry, is the head of a stag, or other animal, represented full-faced, and so as to show the face only, without any part of the neck.

Cabomba/œæ, the Water-shield order, a natural order of plants belonging to the class Dicotyledonous. They are mostly aquatic, with floating peltate leaves. There are only three species in the order, found in America, Australia, and India. They have no important properties—*Cabomba* and *Hydropeltis* are the only genera.

Cabooses, or **Cambooses** (Ger. *kabuse*, 'a little room'), the name of the cook's room in a merchant ship; also, a cast-iron cooking-stove on the deck of coasting vessels.

Cab'ot, John, a sailor of Venetian descent, who had settled at Bristol, obtained in 1496 from Henry VII. five vessels for an expedition of discovery. C.'s idea was to find a N.W. passage to China. He touched at Newfoundland and Labrador, coasted down to Cape Florida, then returned to England in 1497. He was accompanied by his son, **Sebastian C.**, born at Bristol in 1477, who also assisted his father in successive voyages (1498-99) under royal patent, probably to Newfoundland and the Gulf of Mexico. In 1512, C. retired to Spain, where Ferdinand gave him a post in the Council of the Indies. Returning to England on the death of Ferdinand, he was sent, in 1517, by Henry VIII. on a voyage to Labrador along with Sir Thomas Perte: they probably entered Fox Channel to the N. of Hudson's Bay. Subsequently C. sailed to the Brazil coast, but soon entered the service of Charles V., who made him Pilot-Major of Spain. In this capacity he assisted at the conference (1524) which adjudged the Moluccas to lie beyond the Portuguese division of the New World. In 1526, C. led an expedition up the La Plata river, and founded a small colony, Rio Tercero, afterwards destroyed, as much by the jealousy of the Portuguese as by the force of the natives. In 1546-48, having passed the interval in Spain, he once more returned to England, where he received a pension of £166, with the post of Grand Pilot, and took great pains in superintending the arrangements for the expeditions of Willoughby and Chancellor (1553), and Burroughs (1556), which, though they did not make out a N.E. passage, opened up, through the Muscovy Company, the Russian trade in fur, oil, &c. C. died at London in 1557. He left a notable 'Geographical Chart' and accounts of his voyages. See *Memoir of Sebastian C.* (Lond. 1831).

Cabotz, another name for Kousoo (q. v.), or *Brayera anthelmintica*.

Cab'ra (anc. *Agabrum*), a town of Spain, province of Cordova, 12 miles S.E. of Montilla, with manufactures chiefly of woollens, linens, soap, hosiery, bricks, and earthenware. Pop. 12,000. The district is famed for its wine. There are several other small Spanish towns of the same name.

Cab'ral or **Cabre'ra, Pedro Alvarez**, a Portuguese navigator, and the discoverer of Brazil, was born of a patrician family in the latter part of the 15th c. He married Isabel de Castro, first maid of honour to the daughter of João III., and was appointed by King Emmanuele of Portugal (on the recommendation, it is said, of Vasco de Gama) commander of a fleet of thirteen sail and 1200 men, bound for Calicut to re-establish the Portuguese interest there, 9th March 1500. Contrary to his wish, his fleet was carried S.W. across the Atlantic, and on the 24th April he discovered Brazil, and took the land in the name of his king. Sailing thence for India, he reached Calicut, conquered the enemies of the Portuguese, founded a factory, and negotiated a treaty—the first—between Portugal and India. Returning with much booty, he arrived at Lisbon, July 31, 1501. Although his discoveries added the splendid appanage of 'the Brazils' to the Portuguese possessions, the King seems to have been too ignorant of his new territory to be satisfied with C.'s expedition; for, from this time till his death, in 1526, his name is not mentioned among Portuguese navigators. See Ramusio's *Navigazioni* (Ven. 1835).

Cabre'ra, Don Ramon, Count of Morella, Duke de la Victoria, formerly a noted Carlist chief, was born at Tortosa, in Catalonia, 31st August 1810. On the death of Ferdinand and the outbreak of the civil war in Spain, C. joined the Carlists or Absolutists, and his fiery energy and military skill soon gained him a leading command. On two occasions he nearly succeeded in securing the triumph of Don Carlos—in 1837, when he beat the royal troops in two battles, to be, however, himself beaten in a third; and in 1839, when he threatened Madrid. The desertion of the Carlist General Marotto, however, ruined the cause; and in 1840 C. was driven out of Spain and took refuge in France, where, for a time, he was imprisoned in the castle of Ham. Regaining his liberty, he took up his residence in Lyon. He was opposed to the abdication, in 1845, by Don Carlos of his pretensions in favour of his son; but in 1848 he took advantage of the French Revolution to attempt a fresh Carlist rising. He was, however, beaten and severely wounded in the battle of Pasteral, January 27, 1849. After this, he removed to London, where he married a rich English

lady, Miss Marianne Catharine Richards. In the numerous Carlist attempts subsequent to 1848, C. has taken no part, and when, in 1875, a military *pronunciamento* overturned the republic of which Marshal Serrano was the head, and placed Alphonso XII. on the throne of his mother Isabella, he issued a manifesto advising the Carlists to submit. C. died at Staines, 24th May 1877.

Cabrit, a name sometimes applied to the prongbuck or pronghorn antelope of N. America (*Antilocapra furcifera*). See PRONGBUCK.

Cabul' (ancient *Cabura*), the capital of Afghanistan, and also of the Afghan district of the same name, lies near the junction of the C. and Logar rivers, 6300 feet above the sea, in a triangular hollow, and is enclosed by mountains on three sides. It was formerly surrounded by high mud-walls, which have given place to a belt of orchards and gardens. Two of the old gates, of deeply-coloured kiln-burnt bricks, are still standing. The town is divided into quarters (*mahalas*), the streets are dirty and irregular, and the only buildings of any pretension are a few mosques, some fifteen caravansaries, and several large bazaars, of which one especially, about 600 feet long, is regarded as a triumph of Eastern architecture. Much of the town has remained in ruins since its capture by the English in 1842. On a rocky eminence to the S.E. of C. stands the fort of Bala-Hissar, and on the slope are clustered the royal palace and gardens, a large bazaar, and many private dwellings, within the protection of a wall and ditch. The town is wholly commanded by the hills, which are steep, rocky, and bare. C. lies on the Indo-Persian caravan route, and is an important centre of commerce. Heavy duties are here levied on merchandise. C. has a growing trade with Russia, from whence it receives broadcloth, silk goods, velvets, paper, gold and silver lace. It has extremely cold winters, and the temperature ranges in summer from 75° to 85° F. The river C. is here crossed by four substantial bridges. To the S. of the town is the monumental tomb of the Sultan Baber, who made C. the capital of the Mogul empire. Pop. 60,000, of whom many are Armenians and Jews. Within the present century C. has been the scene of memorable events. Accompanied by an English force, Shah Sujah made his state entry into the city, August 7, 1839. The English remained here without hindrance till November 2, 1841, when rebellion broke out, and the garrison was subjected by Akbar Khan to a siege which lasted till the 6th January following. The remnant of the force, comprising 690 British, 3810 Indian native troops, and 12,000 followers, were then allowed to march out, and begin the terrible retreat through the Khyber Pass, a retreat which left only one survivor. A British army, under General Pollock, took possession of the Bala Hissar without opposition, September 15, 1842, and remained here until 12th October, when it withdrew, after destroying several of the most important buildings.—O., or *Cabulistan*, a division of Afghanistan, in the basin of the C. river, is bounded N. by the Hindu Kush and Kafiristan, W. by the mountains of the Paramisus and by Herat, S. by Candahar, and E. by Peshwar and other Anglo-Indian districts on the right bank of the Indus. It is in part arable, and yields wheat, barley, sugar, and coffee. It is governed by a chief, and the revenue amounts to £180,000. The army, the strongest in Afghanistan, comprises 9000 horse and 2000 infantry.—The O. River rises in the Hindu Kush, at a height of 8400 feet above the sea-level, and flows E. through the part of Afghanistan to which it gives name, joining the Indus at Attock, after a course of 320 miles. It is navigable to boats of 50 tons from Duobandi to Attock. The Valley of the C., or the C. Pass, part of which is called the Khyber Pass, forms the famous western highroad to India, traversed by Alexander the Great, Timur, Baber, and Nadir-Shah. See AFGHANISTAN.

Caca'lia, a genus of plants of the natural order *Compositae*, natives of the warmer parts of America, Middle Asia, and Eastern Africa. The Chinese employ the leaves of *C. procumbens* as food, and those of *C. ficoides* of the Cape of Good Hope are also wholesome.

Caca'o. See COCOA.

Cacoc'imo, a town in the province of Palermo, Sicily, 21 miles S.E. of the city of Palermo. Pop. about 6000.

Cac'eres (the *Castra Cecilia* of the Romans), capital of the province of the same name in Spain, 53 miles N.E. of Badajoz,

and 25 miles W. of Truxillo. It is the emporium of the district trade in bacon; much fruit is grown in the neighbourhood, and the town has manufactures of woollens, linen, leather, &c. The Plaza contains some interesting remains of sculpture. Pop. 10,000.

Caceres, Nueva, a town in the island of Luzon, one of the Philippines, in the province of Camarines, 180 miles S.E. of Manila, has a pop. of 12,000.

Cach'alot, or *Sperm Whale* (*Physeter macrocephalus*), a genus of Cetacea, representing the family *Physeteridae*, or *Catodontidae*, the members of which are distinguished by the absence of baleen or whalebone plates, by the lower jaw possessing conical-pointed teeth; the upper jaw also possessing teeth, which, however, with one partial exception, do not cut the gum. The head in the S. W. is very large, averaging about one-third of the length of the body, the muzzle being broad and square, or truncated, and possessing the nostrils or 'blow-hole' on its front surface. The females are smaller than the males, which may measure from 50 to 70 feet in length. The teeth number about fifty-four, and are situated in a common (*alveolar*) groove, imperfectly divided into different and separate *sockets*, or *alveoli*. These whales are gregarious in habits, and inhabit the N. Pacific Ocean more particularly, but also occur occasionally in the Mediterranean and other European seas. The colour of the body is black, or very dark grey on the upper, and lighter on the under parts. It tapers towards the tail, which terminates in a horizontal tail-fin, divided into lobes. The fore limbs, represented by swimming-paddles, are of small size. A small or rudimentary dorsal fin exists.

These whales derive their popular name from their affording *Spermaceti* (q. v.), a fatty substance which solidifies when exposed to the air, and which is extensively used in commerce. This substance is contained within special cavities or *sinuses* of the frontal parts of the skull. The substance known as *Ambergris* (q. v.), supposed to be a *gall-stone*, and used in the manufacture of perfumes, is found in the intestines of these whales. The *sperm-oil* obtained from the blubber is very valuable, and does not possess the peculiar odour of common whale-oil derived from other species.

These animals feed upon cuttlefishes, pteropodous and other mollusca, and allied forms. The older males are known as 'bulls,' and are said to be distinguished by a greyish spot on the front of the head or muzzle. The young males are met with in herds by themselves, the older males being generally solitary in habits. These whales are said to engage in fierce combats, presumably for the possession of the females. The only other species of this family and genus included in the Whale order, is the *Physeter tursio*, or high-finned S. W. or C., so named from its possessing an elevated dorsal fin. The name *Catodon* is sometimes substituted for that of the genus *Physeter*.

Cacha'o, an important city of Anam, capital of the province of Tonquin, on the Tonquin river, about 90 miles from the sea. It stands in an open space, is built chiefly of mud and timber, and does a large export trade in gold, lackered ware (the finest in the East), and splendid silks. As far as C. the river is navigable for small vessels. Pop. said to be about 100,000.

Oache (Fr. 'a hiding-place'), a hole in the ground, usually 6 or 8 feet deep, and several feet broad, for concealing provisions and other articles which it is inconvenient to carry. Travellers over the great prairies of the United States, who mean to return on their tracks, dig such holes, bury their property, and carefully cover it over to hide it from the Indians.

Oachet, Lettres de. See LETTRES DE CACHET.

Oache'ria, a name used in medicine to denote a peculiar vitiated state of the constitution, in which there is great weakness, with or without the local manifestation of some constitutional disease. C. is not itself a disease, but rather a depraved state of the body, the result of some serious malady. It is derived from Greek words signifying 'to have an evil habit of body.' Physicians speak of various C., the chief of which is the cancerous C. (see CANCER), characterised by a peculiar yellow skin, contracted features, desponding look, combined with the expression of great suffering, so characteristic of cancer, and so familiar to medical practitioners.

Cachibou, or **Ohibou Resin**, a fragrant gum resin, obtained from *Bursera gummifera*: that from *B. acuminata* is known in commerce as the resin of Carana.

Cachoeira, a town of Brazil, in the province of Bahia, on the river Paraguaçu, and about 60 miles N.W. of Bahia, the capital of the province. There are in the neighbourhood of C. extensive sugar and tobacco plantations. Pop. 25,000.

Cachrys, a genus of plants of the natural order *Umbelliferae* (*Apiaceae*), natives of the S. of Europe, Siberia, &c. The Cossacks chew the seeds of *C. odontalgica* as a remedy for toothache, the effect being probably owing to the salivation produced. Several species are cultivated.

Cacique, or **Cazique**, a king or chief among some tribes of Indians in Central America.

Cocoa. See COCOA.

Cocodæmon. See DEMON.

Cacodyle, or **Kakodyle**, is a compound of Arsenic (q. v.) with the hydrocarbon radical methyl (CH_3), and has the composition expressed by the formula $\text{As}_2(\text{CH}_3)_2$. It is the principal ingredient of *Cadet's fuming liquor* or *alkarsin*—a spontaneously inflammable liquid obtained by distilling a mixture of arsenious acid and acetate of potassium. C. is an extremely poisonous substance, of a most disgusting odour (whence its name), and is spontaneously inflammable: it combines with oxygen, sulphur, chlorine, &c.

Cacongo, a district on the W. coast of Africa, immediately N. of the Congo river. The coast is flat and unhealthy; but more inland, where the chief town (Kinguela) lies, the country is higher, and has a fine climate and luxuriant vegetation. C., however, has been but little explored. A. Bastian's travels, in 1873 (see *Die Deutsche Expedition an der Loango-Küste*, &c.), were confined very much to the coast region.

Cactaceæ, the Cactus or Indian Fig order, a natural order of plants belonging to the class Dicotyledons—succulent plants, usually spiny and leafless. They are natives exclusively of the tropical regions. There are about 800 species, belonging to eighteen genera—e.g., *Melocactus*, *Mammillaria*, *Cactus*, *Opuntia*, &c. The acid fruits of many of them are used in febrile complaints, and those of a New Mexican species (the 'Pitahaya') form a considerable source of food to the native Indians. The fleshy stems of the melon cactus (*Melocactus*) is eaten by cattle in S. America, and many others are cultivated for their showy flowers. The fruit of the prickly pear (*Opuntia vulgaris*) is now imported into this country from the S. of Europe, where it is much eaten as a dessert fruit. *O. cochinillifera*, the Nopal plant, is cultivated in Mexico, Teneriffe, &c., for the nourishment of the cochineal insect (*Coccus cacti*, q. v.). Some of the plants grow to a great size. *C. Peruvianus* of S. America has a stem 30 to 50 feet in height, and 1 to 2 feet in diameter. *C. Thurberi* has a stem 10 to 15 feet high. The spines and bristles on a plant of *Echinocactus platyceras* have been reckoned at 51,000, and those on one of *Pilocereus senilis* at 72,000.

Cadaiba, a name applied to a genus of plants of the natural order *Capparidaceæ*, natives of Africa, India, and Australia. The roots of *C. Indica* are aperient and anthelmintic.

Cadamba, or **Kudumba**, is a name applied to the wood of several species of *Naskea*, a genus of trees of the natural order *Cinchonaceæ*, natives of the E. Indies. The wood of *N. Cadamba*, a fine tree, is soft, yellow, and fine-grained, and is used for various purposes. *N. cordifolia* is used for packing-boxes, flooring planks, &c.; but this wood, like that of the rest

of its genus, is liable to be injured by damp, and can only be used in a dry place.

Cada Mosto, or **Ca da Mosto**, **Alvise** or **Luigi**, a famous voyager and discoverer on the W. coast of Africa, was born at Venice about 1432. Entering the service of Dom Henriquez, the Infanta of Portugal, he sailed from Lagos on March 23, 1455, visited the river Senegal, and traded along the coast of that region in gold and slaves till, after being joined by two other Portuguese ships at Cape Verde, he sailed southwards and discovered the Gambia. C. then returned to Portugal. In the following year (1456) he discovered the Cape Verde Islands, and the rivers Cazamanza and Rio Grande, after which he returned to Portugal, where he remained till the death of the Infanta in 1463. C. died about 1480. The first account of his voyages, now a very rare book, was published at Vicenza in 1507, under the title *El Libro de la Prima Navigazione per Oceano a le Terre de Nigri de la Bassa Ethiopia*. See Zuria, *Dei Viaggi e delle Scoperte Africane di Cada Mosto* (Ven. 1815).

Cadaveric Rigidity. This is the stiffness of death or *rigor mortis*. Immediately after death there is a general relaxation of the whole muscular system. The joints are flexible, the lower jaw drops, the upper eyelid falls over the globe of the eye. Five or six hours after death this relaxed condition gives place to one of rigidity. The muscles stiffen, and the body for a time maintains the position in which it happened to be when death occurred. Still later, the muscles again become relaxed, and putrefaction sets in. C. R. is due to a change occurring in the muscles. During life the contractile material in muscular tissue is semifluid; after death it tends to coagulate slowly, and when coagulation is complete, the result is C. R. In warm-blooded animals muscular contractility requires a frequent supply of arterial blood. If this be arrested, the muscle gradually loses its contractile power and tends towards C. R.; but, as Brown-Séquard has shown, even after C. R. has made its appearance, it may be removed by the injection into the vessels of warm arterial blood. This physiologist succeeded in removing C. R. from the muscles of the decapitated body of a criminal thirteen hours after death, and two hours after the body had become stiff, by injecting warm human blood from which the fibrine had been removed.

C. R. may come on even while the body is warm. The time of its appearing depends on the state of vitality of the muscular system. The bodies of persons who have died of exhaustive diseases, such as typhoid fever or phthisis, cool rapidly, and C. R. quickly supervenes; whereas the bodies of strong muscular individuals who have died from acute and rapid disease, or who have been cut off by accident, cool slowly, and C. R. may not appear till after the lapse of ten or twelve hours. It is also a general fact that if C. R. comes on soon after death it lasts only a short time, and gives way to putrefaction; while, on the other hand, if it does not appear till many hours after death, it lasts comparatively a longer time. The duration of C. R. is modified by the state of the air. Dry, cold air delays its disappearance; warm, humid air hastens it. It begins almost invariably in the muscles of the neck and lower jaw. For further information, see DEATH, and *Principles and Practice of Medical Jurisprudence*, by Alfred Swaine Taylor, M.D., &c. (Lond. 1873), vol. i. p. 53 et seq.

Caddice or **Caddis Fly** (*Phryganea*), a genus of insects belonging to the order *Neuroptera*, and to the sub-order *Trichoptera* ('hairy-winged') of that group. These forms possess four wings, with branched *nervures* or supporting ribs, the front pair being hairy, and the hinder pair folded in repose. The organs of the mouth, with the exception of the palpi, are abortive; the head being small, and provided with two large compound eyes, three ocelli, and elongated antennæ or feelers. The eggs are deposited in water, the larvæ being aquatic, and forming the familiar *Caddis-worms* of anglers. They are soft-bodied grubs, possessing six feet, and are armed with jaws. They protect their bodies by enclosing them within cases formed of pieces of straws, pebbles, shells, and other heterogeneous materials,

Caddis-Fly.

united by silky threads. These cases are enlarged by the larvæ cutting off the hinder extremity of the case, and adding to the front. The larvæ move about freely by pushing with the head; the front segments being provided with legs. The larva passes to the pupa state by fixing the case, and closing up the two ends with a silky grating, but so as to allow the water necessary for respiration freely to pass into its habitation. The perfect-winged insect bites through the case, and sets itself free in the water. The common species is the *Phryganea grandis*, but very many other species have been described as occurring throughout Europe. These insects are chiefly nocturnal in habits.

Cade, Jack, a popular agitator of the 15th c., was the leader of an insurrection of the commons of Kent, which broke out in 1450, in the reign of Henry VI. It is sometimes spoken of as an insurrection of the peasantry; but 'yeomen and tradesmen formed the bulk of the insurgents,' who were, moreover, joined 'by more than a hundred esquires and gentlemen,' while at least 'two great landowners of Sussex, the Abbot of Battle and the Prior of Lewes, openly favoured their cause' (Green's *Short Hist. of the Eng. People*, pp. 275-276). C.'s influence over the men of Kent was so great, that, to the number of nearly 20,000, they followed him to Blackheath, demanding, among other things from the King, the dismissal of the Duke of Suffolk and the restoration of the Duke of York to favour, and complaining that the commons were overtaxed, plundered by corrupt court officials, and prevented from freely electing the knights of the shire. In other words, the rebellion was *political*, not *social*, like that headed by Wat Tyler. C. defeated a detachment of troops sent against him, and even ruled London for two days, causing one of the King's favourites, Lord Say, to be beheaded. A promise of pardon caused his followers to disperse. C. then fled; but, in attempting to reach the coast of Sussex, he was followed and killed by an esquire of the name of Iden, and his head stuck upon London Bridge as that of a traitor.

Cadence (from Lat. *cadere*, 'to fall'), in music, a succession of chords used at the close of a phrase or composition. The perfect C., or full close, consists generally of three chords, of which the two last are those of the dominant or dominant seventh (the latter containing the two distinguishing notes of the key—*fa* and *re*), and of the tonic. Its use at the end of a composition is now almost universal, but it seems to have been scarcely known until the time of Monteverde (1566-1650), to whom the credit of bringing it into use greatly belongs. The imperfect C., or half-close, is often employed at the end of less important phrases; in it the tonic chord comes before the dominant, so that the latter leaves upon the ear a sense of unrest and expectation. The 'interrupted' C. is used for certain special effects; in it the preparation for the full close is made, but the tonic chord is replaced by some other, sometimes in an entirely different key.

Cadency, in heraldry, is a term applied to the significance of figures and devices introduced into armorial compositions, in order to distinguish the different members and branches of the same family. The label, the crescent, the mullet, and other marks are, especially in Scottish heraldry, used to distinguish the sons from the father, and from one another during the father's lifetime; and the bordure of various kinds, the chief engrailed, embattled, and the like, are similarly employed to mark the difference between the coats-of-arms of brothers after the death of their father, and also to mark the differences of the houses descended from them. The term C. is also frequently applied to such abatements as *bastard bar* (see BAR, BASTARD), which indicate that the arms of a family are diminished or broken.

Cadenza, in music, a more or less ornate phrase, introduced most often near the close of a composition, vocal or instrumental. In some cases composers write their own cadenzas, in others they are left to the performer.

Cader Id'ris (i.e., 'chair of Idris,' a mythical Welsh giant, poet, or prince) is a well-known mountain mass in Merionethshire, about 10 miles long, composed chiefly of basalt and trap rocks. From the loftiest point, *Pen-y-Cader*, 2914 feet high, one can obtain a splendid view westward far over St George's Channel, and eastward to the Wrekin in Salop.

Cadet (Fr. *cadet*, 'a younger brother'; Prov. *capdet*; Low Lat. *capitulum*, a dim. of *caput*, 'the head'; the eldest son being regarded as the first head of the family, the other sons as being

little heads). A *military C.* is a young man studying with a view to service in the army. In this country such students attend the Royal Military Academy, Woolwich (q. v.), or the Royal Military College, Sandhurst (q. v.). At either establishment they receive pay, wear uniform, and are subject to military discipline, although they are, as yet, only working for their commissions as officers. At both, the fee for the son of a civilian is £125 a year, while for the sons of officers there is a sliding scale—a lieutenant paying £40 a year for his son. A commission for the Royal Artillery or Engineers is studied for at Woolwich Academy; high acquirements in mathematics are necessary to pass the entrance examination; the course of instruction comprises surveying, construction, estimating, field-fortification, telegraphy, army-signalling, strategy, military history, and law, and also applied mathematics, metallurgy, chemistry, physics, and practical mechanics. French, German, and Hindustani are also studied. Two years and a half is the shortest period in which a C. can pass through this curriculum. A commission in the line is studied for at Sandhurst College; the entrance examination is not so high, the course of study comprises pretty much the same non-professional subjects as have just been mentioned last, and, in addition to fortification and surveying, it gives prominence to tactics, and military administration and law. The period of attendance is shorter than at Woolwich, and commissions are given to those who stand highest at the final examination.

A *naval C.* is one who is in the preparatory stage for an appointment as midshipman in the Royal Navy. A youth is eligible to a cadetship at from twelve to fourteen years of age. The nominations rest with the First Lord of the Admiralty, except one which a captain may name on commissioning his ship, and two which an admiral may nominate on receiving his flag. The C. has to pass a preliminary examination at the Royal Naval College, Greenwich; he is then, with a view to his being taught rigging and other technical details, sent three months to a training ship, and fifteen months to a sea-going ship, during which time he mess with the midshipmen. At the close of these eighteen months he is eligible to an appointment as midshipman.

Cadet's Fuming Liquor, or **Alkarsin**, a spontaneously inflammable liquor, was discovered by Cadet (1760). It is obtained by distilling a mixture of arsenious acid and acetate of potash, and consists chiefly of Cacodyl (q. v.).

Cadi (Arab. 'we learned in law'), is the title of an inferior judge in Mahomedan countries. Like the Mollah, or superior judge, it is taken from the higher ranks of the priesthood.

Cadiz (Iber. *Gadr* or *Gadir*, 'the city'), the capital of a province of the same name, and, next to Barcelona, the most important trading place of Spain, is situated at the N.W. extremity of the peninsula of Leon Isle, on the W. side of the Straits of Gibraltar, and is separated by the canal San Pedro from the mainland, with which, however, it communicates by means of the strongly fortified bridge of Suazo. It is a fortress of the first rank, and by nature and art one of the most powerful strongholds in Europe, being surrounded with walls, and protected by some ten forts, placed at various points on the coast and on islands. To the N.E. of the town lies the beautiful Bay of C., and on the S.E. the deep and sheltered inlet of Puntales, forming a commodious haven frequented by the largest merchant ships and men-of-war. In late years a mole, about 1000 feet long, has been built between the mainland and C., by which the railway can convey freights of sherry and other goods directly to the ship's side. The town itself has undergone extensive improvements since 1786, and has now beautiful wide streets, and is lit with gas, while many of the houses, which are usually flat-roofed, are faced with marble. It is the seat of a bishop, and has a cathedral of the 18th c., five parish churches, seven old monasteries, three nunneries, a public library, an art museum and academy, an astronomical observatory, three hospitals, a house of refuge, an asylum for the insane, a foundling hospital, two theatres, and a circus for bull-fights. It has also many schools, a medico-chirurgical college, nautical and mathematical schools, and school of art, and a church seminary. Outside the walls of the town, the chief buildings are the beautiful Church San Jose, with its double tower, the large steam-mills, and the San Sebastian fort lighthouse. C. is the port of departure of most of the Spanish foreign mails, has many regular

steam lines, and is a station for the fleets of all nations. Its trade has been greatly increased by the recent railway to Seville. In 1872, its exports to Britain and British colonies alone amounted to £2,540,053, and imports to £590,729; while a total of 1140 vessels (387,850 tons) entered the port, and 1146 vessels (399,560 tons) cleared. The exports are mainly sherry and mineral ores, the total value of the former in 1872 being £2,458,487. Pop. (1864), including the forts and suburbs, 71,914. According to ancient tradition, C. was founded by the Phœnicians, under the name *Cadr* or *Gadir*, as early as 1100 B.C., passed over to their descendants and successors, the Carthaginians, and was subsequently (206 B.C.) taken by the Romans, who named it *Gades*; by the Arabs in 711 A.D., and finally by the Spaniards in 1262. The English, under Lord Essex, sacked and partly destroyed C. in 1596, and again stormed it unsuccessfully in 1625 and 1702. It became the seat of the supreme junta during the revolution of 1808, and was besieged by the French from 6th February 1810 to 25th August 1812, when they retired on hearing of Wellington's successes. The French, however, captured it in 1823, and retained it for five years. The revolution of 1868, which overthrew the Government of Isabella, broke out in C. on the 19th September.

Cadmia, the name applied to the first part of the product of sublimation of roasted zinc ores, which is very rich in metallic cadmium.

Cadmium is a metal, and was discovered in 1817 by Stromeyer in impure oxide of zinc. It very frequently accompanies zinc in its ores, particularly those found in Silesia. In the extraction of zinc by heating the ores with charcoal, the C., being the more volatile of the two metals, distils over first. In order to separate zinc from C., and obtain the latter in the pure condition, crude C. is dissolved in hydrochloric acid, or a stream of sulphuretted hydrogen passed through the diluted solution; yellow sulphide of C. is precipitated, whilst the zinc remains dissolved. The precipitate is dissolved in strong hydrochloric acid, and to the solution thus obtained carbonate of ammonia is added, when pure carbonate of C. is precipitated, and from this compound the metal is readily extracted by distilling it with charcoal at a white heat. In its physical properties, C. is allied to tin. It is malleable and ductile at ordinary temperatures, but becomes brittle when warmed; when bent it emits a crackling sound. It fuses at a comparatively low temperature (315° C.), and boils at 860° C. Its specific gravity is 8.6. In its chemical relations it resembles zinc. It dissolves readily in dilute acids with evolution of hydrogen; it burns when heated in air, forming brown oxide of C. (CdO). It decomposes water at a high temperature. Unlike zinc, however, C. is precipitated from acid solutions by sulphuretted hydrogen, the precipitate which is formed consisting of sulphide of C. (CdS), a bright yellow substance used as a pigment, and called *Cadmia*, or *C. Yellow*. Iodide of C. (CdI₂) and Bromide of C. (CdBr₂) are employed in photography. Its chemical symbol is Cd, and its atomic weight 112.

Cadmus, the mythical founder of Thebes, was the son of Agenor, King of Phœnicia, and grandson of Poseidon. When his sister Europa was carried off by Zeus, C. being sent in search of her, proceeded northward to the coast of Thrace, whence he repaired to Delphi to consult the oracle. He was advised to discontinue his search, to follow a cow which should come in his way, and build a city where it rested. Hence the origin of Thebes, in Boeotia. C. married Harmonia, daughter of Arès and Aphrodité. Domestic calamities drove them from Thebes, and wandering to Illyrium, they died there. Herodotus, and other writers after him, ascribe to C. the introduction of the Phœnician alphabet into Greece. That the Greek symbols were derived from the Phœnician is certain, but when or by whom they were introduced we cannot tell. The solar mythists have no difficulty with C. His name is merely a Græcised form of the Syriac *Kadm*, the east, and therefore he is none other than the sun-god. Everything in the Cadmean myth is *solarised* with equal ease.

Cadoudal, George, the son of a peasant proprietor, was born at Auray, in Lower Brittany, 1st January 1771. Full of Breton enthusiasm for the Church and King, he joined the insurrection of '93 against the Republic, and fought at Savenay. Imprisoned for a time at Brest, he afterwards devoted his whole

patrimony to the support of De Silz's campaign against Hoche. In spite of the failure of the Quiberon expedition, he continued till 1796 the rapid skirmishing war, full of ambushes and secret signals, which Balzac has described in *Les Chouans*. When the coalition was formed in 1799, C., relying on the promise of the Comte d'Artois to appear in Brittany, raised a second revolt in Morbihan, against which Brune had to be despatched with 10,000 men. The triumph of the new consulate induced C. to make peace, when Napoleon strongly urged him to serve the Republic. C., however, retired to England, where he and his friend Mercier plotted against the First Consul. In 1803 he landed in Normandy, expecting that the people would rise under Pichegru and Moreau. Arrested soon after at Paris, he did not deny his treason, and was executed 25th June 1804. See Crétineau-Joly's *Histoire de la Vendée Militaire*.

Caduceus, the wand borne by heralds and ambassadors in time of war. Originally it was a simple olive branch with *stemmata*, which were afterwards formed into snakes. The C. was also an attribute of Hermes, as the messenger of the gods. The snakes were symbolical of peace, Hermes, according to the myth, having divided with his wand two of these animals which he had found fighting. The C. on works of art is surmounted by two wings, emblematical of diligence and activity.

Cæcilia, a genus of *Amphibia* (q. v.), so named from the rudimentary or concealed nature of the eyes. The bodies of these forms (which belong to the amphibian order *Ophiomorpha* or *Gymnophiona*) were formerly included in the Serpent order. They are, however, true amphibians, the young possessing gills, and the adults, as in all amphibia, breathing by lungs. The body is of snake-like form, and may attain a length of several feet. No limbs are developed, and the skin is covered with small scales. The teeth are sharp and recurved, and are borne on the jaws and palate also. The tongue is fleshy, but not protrusible. Numerous ribs exist, but no breastbone is developed. These animals are found in marshy districts of tropical countries, such as Ceylon, Java, and S. America. *Siphonops* or *C. annulatus* is a familiar form. These animals are often confounded with the Blindworms (q. v.) of Britain, which latter, however, are true reptiles.

Cæcum. The C. is the first portion of the great intestine situated in the right iliac fossa, a region corresponding to the right groin. In the human being it is about 2½ inches in length by the same in breadth. It is very large relatively to the size of the intestinal canal in herbivorous animals. For example, in the horse it is a little over 3 feet in length, and is capable of containing 7½ gallons of fluid. In herbivorous animals the C. acts as a reservoir for the large amount of fluid taken by these animals in or along with their food. It is here absorbed by the blood-vessels. The food is not digested in the C., as is often stated, all the molecular changes of digestion having taken place before then. See **INTESTINAL CANAL**.

Cædmon, the first of English poets in point of time, was a tenant, or perhaps only a cowherd, on the abbey lands at Whitby. The date of his birth is not known, but he was contemporary with the Abbess Hilda, who ruled between 657 and 680. The pages of Bede contain all that we know of C. We are there told how, on one occasion, when asked to take his turn in the songs of a festive party, he was forced to confess himself unfit, and stole out abashed to the stable. There he fell asleep, when, in his dreams, there came to him one who called him by name, saying, 'Sing, C., some song to me.' 'I cannot sing,' he answered; 'therefore, leaving the feast, I came hither.' 'If you talked with him made answer, 'However that be, yet shall you sing to me.' 'What shall I sing?' asked C. 'The beginning of created things,' was the reply. When C. told his dream to the Abbess Hilda, and showed her his new power of song, he was received into the monastery, and there spent the remainder of his life. He is supposed to have died about the year 680.

The story of C., related by Bede as a miracle, may probably be taken simply to mean that a natural genius, otherwise untutored, was inspired to poetry by the sublime influences of Christianity. His poem called *C.'s Paraphrase* has been preserved in a single 10th c. manuscript, and how much of it may be genuine is a matter of some uncertainty. The most striking feature of the poem, as a whole, is the blending of its sacred subject with the old Skaldic spirit. Its themes are the war in

heaven, the fall of the rebel Satan, the creation, the story of Eden, the Flood, Abraham and Isaac, the passing of the Red Sea, the narrative of Daniel, Belshazzar's feast. That portion which paraphrases New Testament passages is probably by a 'younger' C.—that is, by some other writer imbued with the same spirit and possessing similar powers. It will thus be seen that this earliest of English poets selected from Old Testament history the most vivid and picturesque incidents. These he treats in the same style of rough power, with its uncouth but bold imagery, its profusion of metaphor, its carelessness of art, that is found in the lay of *Beowulf*. The Christian epic differs from the heathen one in subject, and no more. C. has been called the 'Anglo-Saxon Milton.' His choice of theme may perhaps justify the title, if indeed anything could justify the use of the term 'Anglo-Saxon' in such a case; but the comparison suggested is preposterous. Though far from being on a level with the rhyming chroniclers, he is immeasurably inferior to the later Englishman in wealth and grandeur of thought. Still there are some points of resemblance between the *Paraphrase* and the *Paradise Lost*, chiefly seen in the conception of Satan. These have given rise to the notion that Milton may have read C.'s work—a supposition which is, at least, unlikely. But C. does certainly at times triumph over a language by no means plastic, and a metre the reverse of musical, rising then into epic dignity. C.'s poem was first printed by Junius, at Amsterdam, 1655; more recently by Thorpe (Lond. 1832). Summaries of it are given in Turner's *Hist. of Anglo-Saxons*, iii. c. 3; in Morley's *English Writers*, vol. i.; and Conybeare's *Illustrations of Anglo-Saxon Poetry*. It has been edited by Grein (*Bibliothek der Angel-Sächsischen Poesie*, Göttingen, 3 vols. 1857-63) and Bouterwek (*Cadmon*, with glossary, 2 vols. Elberfeld, 1849-54). See also Watson's *Cadmon, the First English Poet* (Lond. 1875).

Caelatu'ra. See CHASING.

Caen, one of the most picturesque towns of France, capital of the department of Calvados, lies in a beautiful valley at the confluence of the Orne with the Seine, 122 miles W.N.W. of Paris, and 27 miles S.W. of Havre. It is only 8 miles from the mouth of the Orne, communicates also with the sea at Ouistreham by means of a canal, and has a fine basin 1870 feet long, 164 broad, and 16 deep, capable of receiving 80 large vessels. C. abounds in beautiful churches, of which the finest are the *Abbaye-aux-Hommes*, founded by William the Conqueror in 1066; the Church of *La Trinité*, founded by Matilda, wife of the Conqueror; the Church of St Nicolas, now converted into military offices; that of St Pierre, with a magnificent spire of the 14th c.; and *Nôtre-Dame* (1684), in the Italian style. There are also a university, a court of justice, an exchange, a public library of 50,000 vols., an academy of fine arts, a society for the study of Norman antiquities, with a rich museum, many high-class schools, and a theatre. The Orne is here crossed by a granite bridge. C. has manufactures of lace, hosiery, linen, pottery, cutlery, wall-paper, &c.; and there are breweries, dye-works, and shipbuilding. There is a good export trade in corn, wine, fruits, C. Stone (q. v.), &c. The imports are chiefly wood, coal, steel, spices, and coffee. In 1874 there entered the port 662 vessels of 85,739 tons, and cleared 709 of 89,779 tons. Pop. (1872) 32,999. Its ancient name was *Cathem* (though we find in Latin documents *Cadomus*), of which C. is probably a corruption. The town dates from the 11th c.

Caen Stone, a fine-grained white limestone of the Great or Bath Oolite deposits, found in Brittany and in central France. It is a stone of beautiful texture, easily worked into most elaborate carved forms, and therefore highly valued for internal decoration. Since the Norman invasion it has been much used in this country, chiefly for cathedrals and other ecclesiastical buildings. It was used in the building of Canterbury Cathedral and Westminster Abbey, and the new façade of Buckingham Palace is of C. S.

Cænaph'thium, a term applied to the peculiar inflorescence of *Dorstenia*, *Ambora*, and the common fig, in which the receptacle expands, and encloses the flowers within a hollow, almost completely, as in the fig, and partially so, as in *Dorstenia*.

Caerle'on ('city or camp of the legion'), a small market-town in Monmouthshire, on the Usk, 3 miles N.E. of Newport, a station on the South Wales Railway. It has some iron and tinplate works. Pop. (1871) 1306. There is perhaps

no place in England whose fame so entirely belongs to a far-distant past. The *Ica Silurum* of the Romans, it was in the earliest times the capital of Britannia Secunda, and the residence for years of the second Augustan Legion (hence its name). Its relics of baths, amphitheatre, temples; its tessellated pavements and Samian ware; its objects in bronze and iron, glass, enamel, bone, and ivory, preserved in its museum or by private individuals, attest its ancient importance. But its renown, if not its real interest, is legendary rather than historical. When Geoffrey of Monmouth (see ARTHURIAN ROMANCE) withdrew Arthur from his proper principality of Strathclyde to the region of South Wales, he fixed his 'magnificent court' at C. (*Hist. Brit.*, b. ix. c. xii.), and henceforth it shone with peerless lustre in the realm of romance. C. was the seat of an archbishop till the 6th c., and was noted as a school of learning; but it lost its importance after the English conquest, and gradually dwindled down to its present insignificance.

Caermarthen, or **Caermarthen** (the *Maridunum* of the Romans), a flourishing town of Wales, capital of Caermarthen-shire, 80 miles N.W. of Cardiff by railway. It lies on the Towy, 9 miles from its mouth, and is accessible to vessels of 200 tons. C., which was an ancient residence of the Welsh princes, has a fine old castle, extensive docks, a town-hall, and a Presbyterian Welsh college. The Towy is here crossed by a stone bridge. There is an active export trade in lead, bark, corn, coal, butter, and slates. *Caer Fyrdwyn* is the oldest Welsh name of the town. Under the native princes it was the capital of S. Wales till the 9th c., and in later times was the scene of frequent conflicts between the Welsh and the Norman intruders. Along with Llanelli, C. returns one member to Parliament. Pop. (1871) 10,488. C. is the birthplace of General Sir Thomas Picton.

Caermarthenshire, the largest county of Wales, lies mainly in the basin of the Towy, and has an area of 974 sq. miles, and a pop. (1871) of 115,710. It has a hilly surface, intersected by fertile and densely wooded valleys, and produces a large quantity of oats and barley. Besides the Towy, the chief rivers are the Cothy, Taff, and Teify, in all of which there is splendid salmon and trout fishing. The uplands afford excellent pasture, and much attention is given to the rearing of short cattle. In 1873 there were 75,150 acres under corn, 10,752 under green crops, and 326,354 in pasture. Of live stock, C. supported in the same year 17,281 horses, 105,194 cattle, 223,869 sheep, and 26,720 pigs. The geological formation in the N. is Silurian and in the S. Devonian and carboniferous, while the chief minerals are iron, lead, coal, and lime. There are manufactures of tinned iron plates, leather, and flannel, and an export trade chiefly in coal, grain, and cattle. The chief towns are Caermarthen, Llandeils, and Llanelli. C. has many British and Roman remains, and several fine old churches and ruined castles.

C. Bay, an inlet of Bristol Channel, has a marshy coast, is 17 miles wide, and extends along a part of the coasts of Glamorgan and Pembroke. It contains the small island of Caldy, with a lighthouse rising to a height of 210 feet above the sea.

Caernarvon, or **Carnarvon** (*Caer-yn-ar-Fon*, 'city opposite Mona,' the old name of Anglesea), the capital of Caernarvonshire, a municipal and parliamentary borough, seaport, and market-town, on the E. side of the Menai Strait, 235 miles N.W. of London. The town stands on a peninsula, and is defended by strong walls and circular towers. Although it has few or no manufactures, its prosperity as a seaport is greatly on the increase. In 1873, 2566 vessels of 176,386 tons entered, and 2467 of 171,104 tons cleared the port of C. In 1874, the value of the imports of foreign and colonial merchandise was £28,253; the gross amount of customs revenue received, £7499; and the value of the exports, £208,402. The principal exports are copper ore and slates. There is an extensive iron and brass foundry, and shipbuilding is carried on to some extent. C. is a favourite watering-place and resort of tourists. C. itself is not a very old place, but close by is the site of the Roman station Segontium, the *Caer Selont* of the Britons, also called *Caer Custeint* ('camp of Constantine'), which was for some centuries the capital of the princes of N. Wales. C. proper may be said to date from the reign of Edward I., who built here, between 1283 and 1294, a castle whose ruins are unsurpassed in magnificence. Edward made C. a free borough, the first in Wales. In the long border struggle between the Welsh and English it frequently

suffered, and during the civil war of the 17th c. the castle was repeatedly taken both by Royalists and Parliamentarians. C., in conjunction with Pwllheli, Nevin, Criccieth, Conway, and Bangor, returns one member to Parliament. Pop. (1871) 9449.

Caernarvonshire, or **Carnarvonshire**, a maritime county of N. Wales, bounded N. by the Irish Sea, E. by Denbighshire, S. by Merionethshire and Cardigan Bay, W. by Caernarvon Bay and Menai Strait. It is 51 miles long; greatest breadth, 22 miles; area, 369,482 statute acres, or 577 sq. miles; pop. (1871) 106,121. The Snowdon range traverses the county from N.E. to S.W., attaining in Snowdon an elevation of 3571 feet, the greatest in S. Britain. From this four ridges diverge, and in the hollows (*Cwm*s or *Coombes*) between are numerous tarns or lakes of small size, generally the expansions of mountain streams. The largest river is the Conway, which is navigable for 10 miles for vessels of about 100 tons. In 1873 there were 24,217 acres under corn, 8955 under green crops, and 147,934 in pasture. In the same year C. supported 7069 horses, 51,259 cattle, 225,239 sheep, and 19,030 pigs. The mineral treasures consist of copper ore, lead, zinc, coal, and slates, which are quarried and exported in vast quantities; the only manufacture, and that but to a limited extent, is flannel. Caernarvon, Bangor, and Conway are the principal towns; but since the beauties of this part of Wales have been opened up to the public, other places have sprung into some importance, as Llanberis, Llandudno, and Tremadoc. C. returns one member to Parliament. The county contains numerous remains of British fortresses, and several cromlechs and stone circles. It was the scene of the last great struggle of the Welsh under Llewellyn for independence, and amid the fastnesses of Snowdon that gallant prince resisted Edward to the last.

Cæsalpin'ea, a genus of trees of the natural order *Leguminosæ* (q. v.), sub-order *Cæsalpinia*, containing about 50 species. The sub-order comprises about 700 species, including *Senna* (q. v.), *Tamarinds* (q. v.), *Carob* (q. v.), the *W. India Locust-Tree* (q. v.), *Copaiva* (q. v.), *Aloes Wood* (q. v.), *Logwood* (q. v.), *Brazil Wood* (q. v.), *Camwood* (q. v.), *Purple-Heart* (q. v.), and the *Wallaba* (q. v.). The genus *C.* comprises various species noted for their properties—e.g., *C. coriaria*, the twisted legumes of which are astringent, and much used in tanning under the name of *Divi-divi* or *Libidibi*, as are those of *C. Papai* for the same purpose, under the name of *Pi-pi*.

In India the powdered legumes have also been used as an astringent and anti-periodic. *C. Sappan* furnishes the Sappan, Bookum or Wukkuum Wood (q. v.), while *C. echinata* is the Nicaragua Wood (q. v.). There is no British species of the order *C.*

Cæsar, the name of an ancient family of the Julia gens, which claimed as its founder Iulus, son of Æneas. The first known to have borne it is Sextus Julius C., prætor B.C. 208. The origin of the term is uncertain. After the family rose to supreme power, the name C. was used by the emperors prefixed to their own, immediately after the title *Imperator*. Though the family line became extinct with Nero, the name was retained till the death of Domitian. Hadrian allowed Ælius Verus to assume it; thereafter it became the title of the heir-apparent, while that of Augustus was given to the Emperor.

CÆSAR C. JULIUS, son of the prætor of the same name, and Aurelia, daughter of Cotta, was born 12th July 100 B.C. At the age of thirteen, through the instrumentality of Marius, the husband of his aunt Julia, he obtained the dignity of high priest of Jupiter; at fifteen he lost his father, and two years after divorced his wife, Cossutia, in order that he might marry Cornelia, daughter of Lucius Cinna, leader of the Marian faction. This union exasperated Sulla, who, on C.'s refusing to repudiate Cornelia, proscribed him and deprived him of his priestly office and fortune. To save his life C. hid himself among the Sabines, with whom he remained till Sulla, moved by the Vestal Virgins and others, pardoned him, at the same time predicting that that boy would ruin the Roman aristocracy. C. set out for Asia 81 B.C., and under M. Minucius Thermus took part in the sacking of Mitylene, for personal bravery in which he was awarded a civic crown. He next went to Cilicia, but the news of Sulla's death (78 B.C.) caused him to hasten back to Rome, in case there might be some chance of his rising to power. Lepidus had anticipated him; the state was in arms,

but C., with that sagacity which always distinguished him, kept aloof for the time. His policy, however, was clearly indicated by his impeachment of Cn. Dolabella for extortion (77 B.C.), and of C. Antonius (76 B.C.) for the same crime. Though in neither case did he obtain a conviction, the forensic ability which he displayed added to his popularity. Encouraged by the applause which he received, and fully aware of his latent oratorical powers, he sailed for Rhodes to study eloquence under Apollonius Molo; but on the voyage he was seized by pirates, who kept him a prisoner till fifty talents were paid for his ransom. On his release C. pursued his captors, secured, and crucified them. He returned to Rome in 74 B.C., to assume the office of pontifex, to which he had been elected. C.'s star was now in the ascendant, and he endeavoured by his affable demeanour and liberality to secure the good opinion of the people. The first public office to which he was elected was the military tribuneship; but we hear little of him till 70 B.C., when he was brought into close connection with Pompey, then in the zenith of his glory. In 68 B.C. he obtained the office of quæstor, and, after the death of his wife Cornelia, went in that capacity to Further Spain, from which he returned in the following year. He then married Pompeia, daughter of Q. Pompeius Rufus, thereby cementing his union with Pompey. Elected to the curule ædileship 66 B.C., he continued to support Pompey, and increased his own popularity during his term of office by his liberality and munificence. Flushed with his success, and eager to revive the glories of the Marian party, he caused the marbles of Marius, which Sulla had destroyed, to be restored, and placed in the Capitol by night. C. continued favourable to the popular cause, and in 63 B.C., on the death of Metellus, was elected to the office of Pontifex maximus, and shortly after to that of prætor. At this time Catiline's conspiracy was discovered, in which C. is believed by some to have taken part; but neither the persuasions nor bribes of Piso and Catullus could induce Cicero to include him in the number of the conspirators. In 62 B.C. he entered on his office of prætor, and became in 61 B.C. pro-prætor in Further Spain, where his career was a series of brilliant successes. On his return he was elected consul with M. Calpurnius Bibulus (59 B.C.), and succeeded in reconciling Pompey and Crassus, and forming with them the First Triumvirate. With their co-operation C. carried his agrarian law. He now strengthened his union with Pompey by giving him his daughter Julia in marriage. At this time he married Calpurnia, daughter of L. Piso, and, on the expiry of his consulship, obtained for himself the province of Cisalpine Gaul and Illyricum—still further increased by the addition of Transalpine Gaul—for a period of five years. C. was now placed in circumstances favourable to the gratification of his ambition and to the development of his military genius. In 58 B.C. he set out for his province, and with an army of veterans entered on the subjugation of Transalpine Gaul. His first campaign was against the Helvetii, whom he defeated with terrible slaughter near Bibracte (Autun). Not a third of that brave people survived the campaign. His next war was with Ariovistus, a German king, against whom he took the field on the representations of Divitiacus, an Æduan chief, and whose forces he totally routed near Vesontio (Besançon). In the following year (57 B.C.) the Belgic war began. The Remi submitted on his approach; the Suessiones, Bellovaci, and Ambiani succumbed in turn; and lastly the Nervii, after a terrible resistance, were completely overthrown, only 500 fighting men being left of an army of 60,000. After this victory, C. led his army into winter quarters in Central Gaul. Next year he entered on his third campaign; but a difference having arisen between his co-triumvirs, he was detained for some months at Luca (Lucca). A reconciliation having been effected, he proceeded to Brittany, where the Veneti had risen in insurrection. By his tact and vigorous action they were soon overcome, and thus, in three years, Transalpine Gaul was reduced to subjection.

In 55 B.C., Pompey went to Spain and Crassus to Syria, Gaul being continued to C. for five years more—i.e., to 49 B.C. After reducing some German tribes, C. invaded Britain, and soon returned. Next year he made a second invasion, but beyond penetrating a considerable way into the country he achieved little. On his return to Gaul, some of the tribes in the N.E. revolted, but were soon quelled. C. wintered at Samarobriua (Amlens). In 53 B.C. another Gallic insurrection occupied C., who was now gradually drawing towards Italy. The spirit of anarchy and disaffection there seemed to favour his projects,

when a fierce insurrection arose, headed by a young nobleman, Vercingetorix. C., though it was mid-winter, appeared among the rebellious Arverni with amazing rapidity. Vercingetorix, after a determined resistance, numerous successes, and wonderful displays of generalship, was forced to shut himself up in Alesia (Alise in Burgundy) with 70,000 men. C., now placed between two great hostile armies, first routed the combined Gauls without, amounting to over a quarter of a million, and then compelled Vercingetorix to surrender. During the following year C. reduced the few refractory tribes that remained; conciliated the conquered by his kindness, and won over the people by acts of generosity and magnanimity. The death of Crassus in 53 B.C. had left C. no rival save Pompey, who by this time had assumed the leadership of the aristocratic party. Dreading the increasing fame of C., the senate decreed that he should disarm his forces. Antony and Cassius vetoed the decree, were ejected from the senate-house, and fled to C.'s camp. The insult offered to the tribunes was a sufficient pretext for war. C. crossed the Rubicon, hastened southwards, and pursued his rival as far as Brundisium. Thence Pompey sailed for Greece, which he reached 17th March 49 B.C., leaving C. master of Italy. C. now marched to Rome, and thence proceeded to Spain, where he subdued the partisans of Pompey. On his way home he took Massilia, where intelligence reached him that he had been made dictator. After eleven days he resigned the office. He then hastened to Brundisium, and in the beginning of 48 B.C. crossed to Greece. At Dyrrhachium he sustained a repulse from Pompey, now reinforced by aid from Greece, Egypt, and the East, and retreated to Thessaly. In a second battle, fought at Pharsalia on the 9th of August, he overthrew Pompey, who fled to Egypt, where he was murdered. On C.'s arrival in Egypt he became enamoured of Cleopatra, and was involved in the Alexandrine war, which he brought to a successful issue in March B.C. 47. He then directed his steps homewards through Syria and Asia Minor; defeated Pharnaces, son of the great Mithridates, on 2d August, at Zela in Pontus; reached Rome in September; crossed to Africa; routed Pompey's generals, Scipio and Cato, at Thapsus, 6th April 46 B.C., and was in Rome again in July, when he was appointed dictator for ten years. C. now showed great magnanimity, declaring that he would treat Pompeians and Cæsarians alike as friends. Having never yet enjoyed the honours of a triumph, he now celebrated four, commemorating his victories in Gaul, Egypt, Pontus, and Africa; during which he entertained the people with princely liberality. In this year (46 B.C.) he reformed the calendar, thereby conferring an inestimable boon on mankind. In 45 B.C. he went to Spain, and on 17th March defeated Cneius and Sextus, sons of Pompey, on the hard-fought field of Munda. After a brief detention in Spain, he entered Rome in triumph; and, among other honours, received the titles of *Pater patriæ*, *Imperator*, *Dictator*, and *Profectus morum* for life. Statues of him were placed in the temples; he was raised to the rank of a god; the month Julius was named in his honour; his image was struck on the coins; his person was declared sacred, and all the senate swore to watch over his safety. C. now turned his attention to reforms and projects for ensuring the stability of the empire; and having now acquired kingly power, he was desirous also of wearing the diadem. The proposal, however, was received with disfavour, and C. for a time gave up the idea. Meanwhile, in the midst of all his glory, power, and lofty hopes, a conspiracy was formed, with Cassius as ringleader, and C. was assassinated in the senate-house on the Ides (15th) of March 44 B.C. For a time he tried to shield himself from the daggers of his assailants; but when he saw Brutus among the number, he muffled himself with his toga and resigned himself to his fate. Thus perished one of the greatest of men at the age of fifty-six. Originally ambitious, C. latterly had at heart only the good of his country; nor, amid all his successes, did he ever forget the kingly virtue of clemency. He had extended the Roman power over the then known world, bequeathing to his successors an empire powerful, peaceful, and purified. C. was tall of stature, noble in bearing, sharp-featured, pale-faced, with dark, sparkling eyes. He was ambitious, brave, generous, liberal, and learned, but licentious and profligate. His intellectual powers were of the highest order. As an orator, he was surpassed by Cicero alone. As a historian, he is remarkable for purity, simplicity, and vigour of style. As a military genius, he occupies the foremost rank, and his statesmanship was

equal to his generalship. C. was a voluminous writer; but nothing has come down to us except his *Commentaries*, written during his campaigns. The *editio princeps* was printed at Rome in 1449.

Cæsare's was the name of several towns in different parts of the Roman Empire, and was given in honour of the Roman emperor. The most notable are—1. The capital of Cappadocia, originally called Mazaka or Eusebia, situated on the river Argæus, in a swampy plain of no great fertility. When Cappadocia was made a Roman province by Tiberius (18 A.D.), Mazaka received the name of C. Under the Empire it became one of the chief mints of Asia Minor, and remained, down to the later Byzantine period, a political and military centre of Asia Minor. The ruins of C., destroyed by an earthquake, lie not far from the modern *Kaisariyeh* (q. v.), whose name is merely an Arabic corruption of the Latin. 2. The maritime city on the coast of Palestine, on the great road from Tyre to Egypt, called, in Strabo's time, *Turris Strabonis*. It was enlarged, if not originally built, by King Herod, 13 B.C., and named in honour of Augustus. Herod surrounded the city with a wall, adorned it with several palaces of white marble, built a temple, and laid out a harbour equal in size to the Piræus. C. thus became one of the first cities in Judea, the seat of the Roman governor, and the capital of the province. Vespasian was here called to assume the purple, and his son, Titus, made C. a Roman colony and conferred on it many privileges. It is still called *Kaisariyeh*, but is nothing more than a few ruined houses, while its once splendid harbour is completely silted up. 3. The place mentioned in Matt. xvi. 13 and Mark viii. 27 was built at the easternmost source of the Jordan, at the southern base of Mount Hermon. It is the *Panium* of Josephus. Its double name, *Cæsarea Philippi*, was given to it by Philip of Trachonitis, partly in honour of the emperor, and partly after himself, as having enlarged and embellished it. The modern name is *Banîds*, now a village of some forty wretched houses.

Cæsarean Operation, one of the most dangerous operations in surgery (so called because Cæsar was said to have been born in this way), consisting in removal of a child from the mother by section of the abdominal wall and of the uterus. It is an operation sometimes necessary when, in consequence of contraction, obstruction, or malformation, a living child cannot be expelled by the maternal passages; but the danger to the mother is so great that it is rarely performed. In cases where a living child at full time cannot possibly be born, the necessity for Cæsarean section is obviated by the induction of premature labour at an early stage of pregnancy.

Cæ'sium is a rare metal, closely allied to potassium, and is remarkable as having been the first element discovered by the aid of the spectroscopic. (See SPECTRUM ANALYSIS.) The name C. was given to it by its discoverers, Bunsen and Kirchhoff, because of the two blue lines characteristic of its spectrum (*Cæsius*, Lat. 'blue'). C. is contained in many mineral waters, and was first obtained from those of Dürkheim, in which it is accompanied by the metals potassium, sodium, lithium, and rubidium. It is present in largest quantity in a mineral found in the island of Elba, called *Pollux*, which contains 25 per cent. of C.

Caffa. See KAFFA.

Caff'eine, or **The'ine**, is an alkaloid contained in tea, coffee, guarana, and Paraguay tea, and was discovered by Runge in 1820. Coffee contains from '8-1 per cent.; tea from 2-4 per cent. The simplest mode of preparing C. consists in heating well-dried tea in a flask provided with a long neck to a temperature of about 200° C. The alkaloid gradually sublimes and condenses in long, colourless needles in the neck of the flask. C. is only sparingly soluble in alcohol, ether, and water; it has a slightly bitter taste, and is very poisonous; its composition is expressed by the formula $C_8H_{10}N_4O_2$. C. has also been prepared synthetically from another alkaloid, called *Theobromine*, which occurs in cocoa.

Caff're Bread, a name given to several species of *Encephalartos* (natural order *Cycadaceæ*), which have much starch in their stems, and hence afford food to the Caffres of S. Africa, where they are sometimes known as bread-trees.

Caffres and Caff'ria. See KAFFIRS and KAFFRARIA.

Caf'ta, Kât, or Khat, the slender young shoots, with the attached leaves, of *Catha edulis*, a plant belonging to the natural order *Celastraceæ*, which are chewed by the Arabs to produce exhilaration of spirits and wakefulness. It is also used as a decoction. The leaves and shoots of *C. spinosa* are also applied in the same way.

Cagayan, Sulu, an island group in the Sulu Archipelago, N.E. of Borneo. C. is also the name of a river 300 miles long, of a lake, and of a province, in the N. of Luzon, one of the Philippine Islands, with an area of nearly 10,000 sq. miles, and a pop. (1871) of 114,396.

Cagliari, a town of Italy, capital of the island of Sardinia, on the S. coast of the island, at the mouth of the Mulargia. The harbour is large, safe, and fortified. C. is the seat of a university and of an archbishop, has several fine churches and palaces, an interesting museum of antiquities, the remains of an ancient aqueduct, and many other memorials of the Roman period. It has several dockyards, is the emporium for nearly the entire trade of the island, has manufactures of firearms and gunpowder, and exports wine, olives, and salt. Steamers ply between C. and Genoa, and a telegraphic cable connects it with the continent. Pop. (1872) 32,834. C. was a Phœnician colony, and its Phœnician name (Latinised *Caralis* or *Cararis*) has suffered little change.

Cagliostro, Alessandro, Comte de, or Giuseppe Balsamo, born of poor parents at Palermo, June 2, 1743, after a short period of service in the convent of Cartegirone, and an idle, thievish life at home, went to Rome, where he married Lorenza Feliciani, the daughter of a girdle-maker, and tried to support himself by drawing and painting. C. was already an adept in forgery, and in predicting fortunes and showing visions by means of phosphorus and legerdemain. He and his wife now determined to take up imposture as a profession. They visited Venice, Marseille, Madrid, Lisbon, Brussels, &c., C. sometimes appearing as a Prussian colonel, a Marquis Pellegrini, and finally as Count C.; his wife, who took the name of Seraphina, enticing men of wealth by her beauty. Having picked up a little chemistry at the convent laboratory, C. was able to profess a quack alchemy; he sold a 'beautifying water,' and 'wine of Egypt,' for renovating the complexion. In 1772 he was in England as a house-painter; in 1776 he did business as a quack in Whitcombe Street, London, but was thrown into prison. He next took up freemasonry, writing a book in which he promised his adherents, by means of the 'prime matter' and the 'acacia,' a perfect physical and moral regeneration. C. himself assumed the title of Grand Cophta, and arranged a number of absurd rites. Successful in Saxony, he was exposed at St Petersburg by the imperial physician Mouncey, and in Warsaw by a Count M——, who published the book, *C. Démasqué à Varsovie en 1780*. In 1783, C. appeared at Strasburg, where he cultivated the intimacy of Cardinal Louis de Rohan, with whom he afterwards suffered imprisonment and trial (31st May 1786) for complicity in the affair of the Diamond Necklace. He then started the quack business again in Sloane Street, Knightsbridge, where, among other dupes, he met Lord George Gordon. Driven from England, and from Turin and Trent, for his character was now becoming notorious, he in 1789 reached Rome, where he was seized and thrown into prison by the Inquisition. In 1791, his manuscript of Egyptian masonry was ordered to be burned, and C. himself was sentenced to perpetual imprisonment in the fortress of St Leo, where he lingered till 1795. In 1787 Goethe visited C.'s family at Palermo. See Carlyle, *Miscellaneous Essays*, vol. v.

Cagno'la Luigi, Marchese, an Italian architect of noble family, born at Milan, 9th June 1762. He was sent by his father to study jurisprudence at Rome in 1776; but, inspired by the noble monuments with which he there found himself surrounded, he decided to devote himself to the study and profession of architecture. Genius and rank combined to make him famous. Napoleon created him member of the *Conseil des Anciens* and Chevalier of the Iron Crown. C. died 14th August 1833. His principal works are the *Arch of the Simphon* and the *Arch of Peace* (Milan), commissioned by Napoleon in 1802 and 1804, and the former of which is believed to be the most beautiful arch of modern times.

Cag'ot, or Argot (which has been derived from the Celtic *cakod*, 'dirty,' the Gothic *gass*, *canes Gothi*, 'Gothic dogs,' and

cassot, 'leprous'), is properly applied to an extinct race of deformed dwarfs among the peasants of the Pyrenees, closely allied to the Cacos and Caqueux of Brittany, the Colibets and Cahets of Saintonge, the Marans of Auvergne, and the Caffos of the Alps. Their natural defects of mind and body were aggravated by the law of the Estates of Navarre and Bordeaux (1672) prohibiting C. to marry any but C., and requiring them to wear on the shoulder a mark in red cloth of a goose's or duck's foot. They were shunned and set apart by their fellow-Christians: each village had its 'Fontaine des C.,' where alone they might drink; each church a door 4 feet in height, by which they must enter, and a separate *benitier*, where they must sprinkle themselves; each cemetery its distinct place of interment. The priest handed them the wafer at the end of a stick. A suspicion of Gothic-Arian heresy attached to them. Only the most repulsive labour was assigned to them by the town authorities, but they were allowed to be carpenters and rope-makers. At the Revolution of 1789, the C. managed to destroy nearly all documents and monuments preserving the history of their families. Now, therefore, only here and there, as in the valleys of Ossau, Aure, and Lavedan, does the suspicion of C. descent rest upon a family, and show itself, not in the denial of rights, but in silent aversion. The name, however, lingers in such proverbs as that applied to a very stupid person: 'Il est pire que le C. de Gamachie.' The 'Leper's Bath' at Aix is an interesting relic of this 'accursed race.' There are among the Pyrenean Cagots many *crétins* (imbeciles with stunted limbs, huge heads, dull eyes, lolling tongues), and persons with *gottres* (bladder-like lumps of glandular flesh, covered with knots of blue veins, depending from the lower jaw and front neck), but the home of *crétinisme* is Aosta (in the Porte de Suveye, or Porta Decumana, of which city is the Tour du Lépreux, celebrated in Xavier de Maistre's beautiful story), and the canton Valais, especially Martigny. In the Val d'Aosta, from Villeneuve to Châtillon, from one-fourth to one-half of the population is affected. There are all degrees of imbecility, from complete vacancy, to the *crétin* who can count and tend cattle. Many, however, are deaf and dumb, and many have the *gottre* (Latin, *guttur*), which, however, is met with also in perfectly intelligent and healthy men and women. *Crétinisme* may be hereditary in a latent form, but it is common to find healthy children of *crétins*; nor is the disease entirely derived from hygienic conditions, for it is found occasionally in the higher classes. Its cause has been suggested by McClelland to lie in the calcareous geological formations, on which, and not on the granites and metamorphic series, it has been observed to prevail. The better view seems to connect it with the atmospheric conditions which have been found to influence epidemics. These are assisted by filthy habits and dwellings, and by the illegal marriages which still take place among *crétins*. The inveteracy of the constitutional tendency is shown by the failure of Dr Guggenbühl to cure *crétins* removed at an early age to his establishment, the Abendberg, at Interlaken. The Spanish Cagots of Navarre are said to be tall, strong, well-built in person, and of regular features. The word C. is used in French in distinction to *bigot*, to denote an aggressive religious hypocrite. The name also occurs in the forms *Capot*, *Gabel*, *Cassati*, *Chrestian*, *Gavacho* (from *Gabali*, mountaineer). *Gafso* is an old word for a leper. *Crétin* is not derived from *Christianus* (in the sense of innocent), but from *craie* (Lat. *creta*), which refers to the sallow complexion of the class. The chief medical and statistical authorities on Crétinism are St Lager, *Études sur Crétinisme* (Par. 1867); Morel, *Traité des Dégénérescences* (Par. 1851); Niépce, *Traité du Gottre* (1851). Among German writers on the subject may be mentioned Iphofen (1817), and Kösch and Maffei (1844).

Cahete, or Quiete, a town of Brazil, in the province of Minas Geraes, and standing on the right bank of a river of the same name, a tributary of the Rio Doce. It is about 280 miles N. by E. of Rio de Janeiro. Agriculture and mining are the chief industries. Pop. about 6000.

Cahir (Irish Gael. *Cathair*, 'the stone fort'), a town of Ireland, county of Tipperary, lies picturesquely on the Suir, 43 miles N.W. of Waterford by rail, has large flour-mills. It was formerly the residence of the Earls of Glengall, and on an island in the river there is a castle of the 12th c., the original 'stone fort' from which the town takes its name. Near C. are extensive barracks. Pop. (1871) 2694.

Cahors, a town in the department of Lot, France, on the

right bank of the river of the same name, 60 miles N. of Toulouse. It has a cathedral, built at the close of the 10th c., and adorned with two cupolas, an interesting specimen of the Romano-Byzantine architecture; an obelisk to Fénelon, erected in 1820; and some remains of a Roman amphitheatre and of a magnificent aqueduct. The principal manufactures are pottery, cotton yarns, woollen stuffs, and leather; and there is a trade in wine (produced in the neighbourhood), brandy, oil, and cattle. Pop. (1872) 11,416. C. is a very ancient town. It was first called *Divona*, then, from the people who possessed it, *Cadurci*, of which C. is only a corruption. Under the Romans it became a municipal city, and was the point of intersection of four Roman roads. Visigoths, Vandals, Franks, Saracens, Normans sacked it in turn, and in the Albigensian wars of the middle ages it was a stronghold of Catholicism.

Cai'cos and Turks Islands, a small group in the W. Indies, about 150 miles N. of Hayti, with a total area of 420 sq. miles, and a pop. (1871) of 4723. They belong to Britain, and have a local president, subordinate since 1873 to the Governor of Jamaica. Chief of the group are Great, N., and E. Caicos, Salt Clay and Grand Turk. They have exports of sugar, cotton, and salt, amounting yearly to about £25,000; while the imports are valued at £30,000. The C. yield a revenue of £8000. Of the inhabitants, 572 are white, 758 coloured, and 3393 black; while 3315 belong to the Methodist and Baptist Churches.—The name C. or Keys is applied to various other small clusters of isles or rocks, as the Keys of Eleuthera, of Providence, of Florida, &c.

Cai'fa, or Haifa (anc. *Hefa*), a small seaport on the coast of Palestine, lies at the N. base of Mount Carmel, on the S. shore of the Bay of Acre, 13 miles across the bay from Acre. It has a good harbour, but no large buildings. The exports are chiefly wheat, sesame seed, and barley. In 1873 there entered the port 584 vessels of 72,886 tons, 52 being steamers. Pop. 2000, comprising Moslems, Jews, and a few Europeans.

Caillie or Caillé, René, an enterprising French traveller in Africa, was born at Mauze (Deux-Sèvres), September 19, 1799. The reading of *Robinson Crusoe* enkindled in him while a boy a passion for foreign adventure. At the age of sixteen he set off with sixty francs to find his way to Senegal. Residing there as a trader in 1826, he heard of the prize of 10,000 francs offered by the Geographical Society of Paris to the first traveller who should visit Timbuctu. Leaving Sierra Leone in March 1827, he reached that city in May the following year. He next crossed the Sahara to the Tangier coast, and arrived at Fez in August. He received the prize, and subsequently an annuity of 1000 francs, and also the decoration of the Legion of Honour. His notes of travel, to which M. Jomard, a member of the French Institute, added geographical remarks, were published under the title, *Journal d'un Voyage à Tombouctou et Fenné, dans l'Afrique Centrale, &c.* C. died near Paris, 17th May 1838.

Cain (according to Gen. iv. 'the obtained') was the first-born of Adam and Eve. His brief history is familiar, and need not be given here. According to some modern critics, the narrative can scarcely have reached us in a strictly historical form, since we are told that he was afraid of being killed, when there was no one to kill him but his own family, and that he built a city when he had only one son. It has therefore been conjectured that in the story of C. and Abel, with their posterity, we see symbolised the facts that the pristine pastoral life was one of simplicity and purity, and that progress in civilisation is accompanied with violence and godlessness. The notion that the story of the offerings is intended by a (late) priestly writer to give a divine sanction to the Levitical law, that an Israelite should never bring an offering of the fruits of the ground except when he had not an animal, lies outside the region of secure criticism.

Cainozo'ic or Kainozoic Period, in geology, the name applied to the newest or most recent epoch, which includes rocks the fossils of which consist of species mostly identical with existing animals and plants. This epoch includes the so-called *Tertiary* rocks, which may be divided, beginning with the oldest of the series, as follows:—1. *Eocene*, lower, middle, and upper. 2. *Miocene*, lower and upper. 3. *Pliocene*, older (white and red crags) and newer (Norwich crag). 4. *Pleistocene, Post-Tertiary, or Quaternary*, post-pliocene, including glacial, pre- and post-glacial deposits, and recent (existing soils).

Ca Ira, 'That will go on,' the refrain of a well-known song of the Jacobins during the first French revolution. It gave a title to the song, which, as the *Carillon National*, 'the national chime,' was, like the *Marseillaise*, the *Carmagnole*, the *Chant du Départ*, adopted as a national lyric.

Caird, Rev. John, D.D., Principal of Glasgow University, was born at Greenock in 1820. He studied at Glasgow University; was ordained to the parish of Newton-on-Ayr in 1845, and transferred to Lady Yester's Church, Edinburgh, in 1847. After remaining there two years, C. accepted, in 1850, the charge of Errol, in Perthshire—this step being taken owing to impaired health. *The Religion of Common Life*, a sermon preached by him before the Queen in the parish church of Crathie in 1855, was published the same year by royal command. He became minister of Park Church, Glasgow, in 1857; published a volume of sermons in 1858, and received from his own university the degree of D.D. in 1860. In 1862 he became Professor of Divinity in it, and eleven years later was appointed Principal. C.'s latest publication is *The Universal Religion*, a lecture delivered in Westminster Abbey on November 30, 1874. C. is the most eloquent and thoughtful rhetorician in the Scotch Church, and has a fame not confined to his denomination or his country.

Cairn is a Celtic word signifying heap, and appears constantly in the names of mountains in Celtic districts. It is also applied to the heap of loose stones which marks the summit of a hill, and which is the simplest form of the monumental C., whether raised as a boundary, a tombstone, a rendezvous, or to commemorate a battle, or other striking event. The more important cairns, however, are raised over stone chambers and galleries. In the famous C. at New Grange on the Boyne, a low tunnel leads to a central chamber 20 feet high, other chambers branching off at the sides. At Stennis, in Orkney, there is a remarkable stone-burrow, called Maeshowe, a conical mound of stones covered with earth, and surrounded at the base by a ditch. A gallery leads to a chamber, built to the height of 6 feet with long hewn slabs of stone of miscellaneous length, the upper portion of the walls (of which 7 feet still remain) being constructed of long unbroken slabs which shorten with each course, and thus form a sort of 'rectangular dome.' The arch must have been unknown to the builders. A very similar C. in wood has been found at Jellinge, Denmark, and is supposed to be the tomb of Queen Thyra. The runes on the stones of Maeshowe were found to be of comparatively modern date; but the sculpture on the granite blocks of New Grange, which have been likened to those found in the Breton district of Morbihan, in the forts of Rowton Lynn in Northumberland, and at the Laws near Dundee, is probably more ancient. The purpose of these burrows is not known: once erected, they would naturally be selected for burial, inscriptions, and perhaps deposits of valuable articles.

The smaller cairns, so common in the pastoral districts of the centre and N. of Scotland, were undoubtedly constructed for burial: they frequently contain human remains in stone kists, or boxes made of stone slabs. They also contain inverted urns, mostly circular in shape, and of the capacity of a gallon, which also sometimes lie in kists, or are simply protected by the surrounding stones. Flint and stone implements occur along with the urns, which are sometimes so numerous in one C. as to suggest that a family has been interred, or that the place marks a skirmish. Besides the kelts or stone axes, various articles in bronze, hatchets, spearheads, shields, and cooking-pots, have been found, and a few personal decorations in gold, bone, serpentine, amber, &c. It is out of these materials that the celebrated hypothesis of the stone, bronze, and iron ages has been manufactured.

Cairngorm (Gael. 'the Blue Peak'), a mountain in the S.W. of Aberdeenshire (q. v.), 4090 feet high. It gives name to a brownish-yellow variety of quartz or rock crystal. This crystal is a distinguishing feature in Scotch jewellery and lapidary-work, and is much prized for setting in plaid brooches, the tops of dirks, snuff-mulls, &c., besides being used like other precious stones for bracelets, ear-rings, studs, seals, &c.

Cai'ro (Arab. *Masr-al-Kähira*, 'capital of victory'), the capital of Egypt, lies on the right bank of the Nile, 5 miles above the Nile Delta, in a sandy waste, which stretches to the Mokat

tam mountain range. It is the most important centre of learning and commerce in the E., and has now extensive railway and telegraphic communication. The town, which is divided into quarters, separating the various creeds and nationalities, has undergone vast improvement in late years. It is lighted with gas, and has an excellent water supply, while many fine broad streets (1875) have been opened through the crowded parts, which were formerly so fruitful of epidemics. The Ezbekiyah, a filthy refuse place, which long disgraced a fashionable part of C., was (1873) converted into an ornamental garden, with an artificial lake, and enclosed with iron railings. Several beautiful carriage roads have been constructed, notably to the pyramids, to Heliopolis, and to the suburb of Bulak (q. v.). All these new roads and streets are bordered by acacias and sycamores. Another great public work is the erection of a magnificent iron bridge over the Nile, completed in 1874. The chief buildings are the citadel, the viceroy's palace, the mosque of Sultan Achmed-Ibn-Tulun, which was built in 879 A.D., and is older than the town itself, and that of Sultan Hassan, finished in 1362. These mosques are of vast size, and have minarets of immense height, built of alternate lines of red and white stone. The former is specially notable for an extensive arcade of pointed arches, supposed to be the earliest extant specimen of this form of architecture. C. has also an Italian opera-house, a French theatre, and a large circus, for which in the winter season the performers are brought from France, England, and Italy. In educational matters, C. has been greatly advanced under the present viceroy. In 1872 the Government colleges of the town had 141 professors and 1025 students, and the national schools had 255 teachers and 11,495 pupils, of whom 6774 belonged to the theological university attached to the Mosque-al-Azhar. The small body of the Copts in C. erected a church in 1867, and the German and English colonies have also recently opened Protestant churches. The trade of C. is rapidly increasing. The exports consist of native produce, of which the chief items are ivory, gum, wood, hides and ostrich feathers, and from Upper Egypt cotton and sugar; while the imports are mainly indigo and shawls from India and Persia, sheep and tobacco from Turkey and Syria, cotton and woollen goods, prints and hardware from Great Britain and Germany, and cloth, furniture, and millinery from France and Austria. In 1872 the value of the exports to Britain alone was £16,455,731, and of British imports £7,213,063. In 1873 some 120,000 lbs. of ivory were exported, chiefly to Britain, while 50,000 lbs. of wax were received by Kartoum from Abyssinia. The traffic in slaves still continues, but is now carried on much more secretly. C. has railway communication with Alexandria, and on the left bank of the Nile with Embaba, to be continued as far as Tell-el-Barud, while a line has been projected in a southerly direction as far as Kartoum. The railway to Suez across the desert has been abandoned since the completion of the Suez Canal Company's fresh-water canal, and passengers are now conveyed from Alexandria to Suez by a new line *via* Zagazig and Ismailia. A great variety of languages are spoken in C., but Arabic predominates. Pop. (1872) 349,883, of whom the majority are Arabs, there being also many Turks, who form the ruling class, Jews, Armenians, Africans, Europeans, and a few Copts, descended from the ancient Egyptians. C. was founded by the Fatimite Califs in 969 A.D., and its fortress was built by Saladin in 1176. It was taken from the Mamluke princes by the Turkish Sultan Selim in 1517. It was taken by the French in 1798, and in 1801 by the British, who restored it to the Porte. The terrible massacre of the Mamlukes took place in C., March 1, 1811. The tombs of the Mamluke rulers of Egypt, about a mile from the city, are singularly beautiful, being built of white marble, richly carved and coloured, and supporting gilded domes.

Caisson, in civil engineering, is a large case of timber or iron capable of floating by itself, and in or on which the piers of a bridge are built. In the former case, the C. merely serves to keep the water away from the workmen, and may be removed when the masonry is finished; in the latter, it forms itself the substructure, sinking by the weight of masonry above it (or by the excavations of divers or workmen underneath it) as the work progresses. In military matters, a C. is a name sometimes given to an ammunition wagon. In connection with shipping, a C. is a large floating air chamber, used for raising sunken vessels.

Caithness, a county in the extreme N.E. of Scotland, with an area of 455,708 statute acres, or 712 sq. miles, and a pop.

(1871) of 39,992. It forms a bold peninsula (hence the Norse *ness*, or 'nose') between the Moray and Pentland Firths, and from N. to S. is about 40 miles long, with a breadth from E. to W. of about 30 miles. The general character of the surface is flat, much of it being heath-covered moor. The formation is Devonian throughout, with the exception of patches of granite on the W. border, and in many parts is highly fossiliferous. Agriculture rather than grazing prevails, though of late years sheep-farming has been extending. In 1873 there were under crops or in grass 101,220 acres. The chief grain crop is oats; green-cropping, especially in turnips, is successful, and the cultivation of artificial grasses has been introduced. Black cattle and sheep are reared in large numbers for the markets of the S. In 1873 there were 22,037 cattle, 167,491 sheep, and 4928 horses. There are no lakes of any size, and no navigable rivers. Weaving is carried on to a limited extent, but, properly speaking, there are no manufactures. The chief industry is fishing, in which about 10,500 persons are engaged, the value of the boats and nets being estimated at £132,000. Over 200,000 barrels of salted herrings are exported yearly; other exports are salmon, oats, and *C. flagstones* (q. v.). Wick is the county town; Thurso is the only other town, but on the E. coast there are many fishing-villages. A railway traversing C., and connecting Wick and Thurso with the S., was in operation in 1875. C. returns one member to Parliament. C. was long in the possession of the Norsemen, and many of the localities have Norse names; while many of the inhabitants, especially on the E. and N. coasts, are of Scandinavian descent, and use a dialect of Lowland Scotch which has a considerable infusion of Norse words.

Caithness Flagstone, a very hard, compact, close-grained stone, occurring in beds from one to nine or ten inches thick in the old red sandstone of Caithness. It is in very great request for the foot-pavements of towns, and more than 10,000 tons are annually quarried in Caithness for that purpose.

Caius (a Latinised form of *Kaye* or *Key*), Dr John, was born at Norwich, 6th October 1510, and educated at Gonville Hall, Cambridge. He studied medicine for two or three years in Italy, and after his return practised at Cambridge, Shrewsbury, and Norwich. He was appointed by Henry VIII. Lecturer on Anatomy to the Company of Surgeons, London; became President of the College of Physicians, and also physician to Edward VI., Mary, and Elizabeth. In 1557 he elevated Gonville Hall into C. College, of which he became master, and continued so till his death at London, 29th July 1573. C. wrote on a great variety of subjects—antiquarian, scientific, and critical. A complete list of his works is given in Cooper's *Athene Cantabrigienses*.

Caius College (properly *Gonville and Caius College*), Cambridge. Gonville Hall, the original institution, on which C. C. was subsequently grafted, was founded by Edmund Gonville in 1348; enriched and removed to the present site of the college in 1353 by William Bateman, Bishop of Norwich, and refounded and erected into a college under royal charter, with the title of *Gonville and C. C.*, by Dr John Caius (q. v.) in 1558. It is known locally as 'Key's College,' from the circumstance that Kaye or Key was the baptismal name of its founder. New statutes were given under the provision of an Act of Parliament (19 and 20 Vict., c. 88), by which the college consists of a master, thirty fellows, and thirty-six scholars. The number of fellowships is now increased to thirty-two by the creation of a new fellowship in 1865 and of another in 1870. The fellowships are not vacated by marriage. The actual number of scholarships on the foundation is forty, and in addition to these, two more have quire recently been founded by the late Dr Shuttleworth of Berne (for proficiency in botany and comparative anatomy), which are of the value of £60 each, and are tenable for three years. There are also the five Tancred studentships in medicine, of the value of £100 annually, and which may be held from three to eight years. The number of undergraduates in attendance (1875) was 139.

Cajanus (from *Cajang*, the Malayan name of one of the species), a genus of plants of the natural order *Leguminosæ*, section *Papilionaceæ*. *C. Indicus*, a native of the E. Indies, is now cultivated in the W. Indies, tropical America, and Africa, and on some of the Pacific Islands. In Jamaica it is called the Congo

pea. *In India the pulse or seed is called *dhal* or *dhol*, or *urhur*, and forms a large portion of the food of all classes. In the W. Indies the pulse is called pigeon-pea, and is used as a substitute for English peas, also for feeding pigeons and other fowls. The variety known as No-eye pea is most esteemed. The Congo pea is harder and coarser. Horses and cattle are very fond of the young branches and leaves, either in a fresh or a dried state. It is one of the most generally useful of tropical plants. See *Treasury of Botany*.

Cal'eput, Cajuputi (*Melaleuca Cajuputi*, or *M. minor*), a tree of the natural order *Myrtaceæ*, sub-order *Leptospermeæ*, from the leaves of which the oil of C. is obtained by distillation. It is a native of the mountainous portion of the Molucca Islands, and much of the oil is prepared in the island of Banda. The oil is pungent, volatile, aromatic, green, transparent, and limpid, and with so pungent, penetrating an odour that it is only agreeable when diffused. Two sackfuls of the leaves will scarcely yield three drachms of the oil. At one time it was much employed in cholera, though apparently without success. It is still used internally as a stimulant, as an antispasmodic, and as a diaphoretic; externally, when mixed with olive-oil or dissolved in rectified spirits, as a stimulant embrocation in rheumatism, neuralgia, &c. It has the property of dissolving caoutchouc. In Australia the leaves of *M. scoparia* and *M. genitifolia* are used as substitutes for tea.

Cake-Breaker. Within the last quarter of a century, the increasing demand for animal food has rendered it imperative that the natural supplies of hay and roots should be supplemented by artificial feeding stuffs, in order that cattle and sheep should be ripened at an earlier age, and brought up to heavier weights. Oil-cake, cotton-cake, and a variety of other condimental substances are employed in fattening. It has been found that much cake is wasted when given in a whole state, and a machine was invented for the purpose of breaking it into pieces of from 1½ to 2 inches square. The machine consists of a box set upon iron legs; within the box revolve in opposite directions two iron-teethed rollers, which speedily disintegrate the cake to the required size. The machine is not costly, and the economy very great. There are many good machines in the market; but perhaps those of Messrs Samuelson of Banbury and Pickley Sims of Manchester are the best.

Calabar', part of the coast-land of N. Guinea, Africa, extends from the river Benin to the Cameroon Mountains, and receives its name from the two rivers the Old and New C., the former of which rises in the Qua Mountains, and flows W. then S. into the Bight of Biafra, its estuary being 9 miles broad at the mouth. This river is navigable to steamers for 200 miles, and on its banks are situated the principal towns of the Qua Land, Duke Town, Creek Town, Omun, and Acuno-cuno. The produce of Qua consists of yams, sugar-cane, palm-oil. The New C. forms one of the mouths of the Niger, and carries on, like the Bonny, though to a smaller extent, a trade in palm-oil and slaves. The natives are polygamists and cannibals, and have not been much affected by the missions which have been long established there by the United Presbyterian Church.

Calabar Bean (*Physostigma venenosum*, natural order *Leguminosæ*). This remarkable plant was first accurately described by Professor Balfour, and the name *Physostigma* was by him given to the plant on account of its peculiar hooded stigma, and *venenosum* in reference to its poisonous properties. C. B. is a native of Old Calabar, Western Africa. It is a large, twining, shrubby plant. Its stem is often about 40 or 50 feet long, and varies from 1 to 2 inches in thickness. It has alternate leaves, and large, beautiful, purple flowers. Its pod is about 7 inches in length, and contains two or three seeds. The seeds are used in medicine, and are possessed of very poisonous properties. They are about the size of a large horse-bean, reddish-brown externally, white internally. They weigh about one drachm each, are kidney-shaped, with two flat sides, and a longitudinal furrow running along its convex margin, ending in an aperture near one extremity of the seed. They taste like ordinary beans, are without bitterness or aromatic flavour. The poisonous properties of this substance have long been known to the natives of Old Calabar, and by them C. B. has been extensively used for criminal purposes. When a person is suspected of having committed a

crime, he is made to swallow some of the C. B., and if he survives the ordeal he is pronounced innocent; but if he dies, it is held to prove his guilt. When the administrator of the poison wishes the suspected person to survive, he generally administers the poison mixed with some powerful emetic, so that the vomiting which ensues may save the person's life. It is called by the natives 'Esere,' and by the European missionaries 'ordeal bean of Old Calabar.' Some of these beans were brought to Scotland by these missionaries, and the physiological effects of C. B. have been carefully investigated by Sir Robert Christison, Dr T. R. Fraser, and others. C. B. acts specially on the spinal chord, rendering the patient insensible to pain, and perfectly unable to walk or move. It, however, is without effect on the sensory nerves or the brain, so that the person under the influence of C. B. is perfectly conscious to the last. C. B. produces death in two ways, either by paralysis of the muscles of respiration, *Asphyxia* (q. v.), or by paralysis of the ganglia of the heart, *Syncope* (q. v.). Its most remarkable effect is its power of contracting the pupil when a solution is dropped into the eye. In this respect it is antagonistic to Belladonna (q. v.). This property of contracting the pupil is useful in certain diseases of the eye, when we wish to diminish the amount of light admitted into that organ. C. B. has been given internally for tetanus or lockjaw, and other nervous affections, in doses of one to four grains. In cases of poisoning with C. B., give Emetics (q. v.) and stimulants.

Calabash Nutmeg, the seeds of *Monodora Myristica*, a plant of the natural order *Anonaceæ* (q. v.), the Custard-apple order, having aromatic properties similar to the true nutmeg. They are commonly known as Jamaica or American nutmegs.

Calabash Tree (*Crescentia Cujete*), a tree of the natural order *Bignoniaceæ* (q. v.), sub-order *Crescentiaceæ*, a native of the W. Indies, and the tropical parts of S. America. The wood is tough and flexible, and adapted for coachbuilding; but it is the *calabash*, or hard shell of the fruit, which is most used. Cups and vessels of all sorts, often beautifully polished and carved, are made from them; they will even withstand the action of fire, and can therefore be used as kettles.

Cal'aba Tree. See CALOPHYLLUM.

Calabo'sa, or **Calabo'zo**, a town in the state of Caracas, Venezuela, on the left bank of the river Guarico, a tributary of the Apure, and 185 miles S.W. of Caracas. It was formerly an Indian village, and is now the residence of many wealthy proprietors of cattle-farms (*hatos*) in the surrounding llanos. Pop. 4000. Since 1813 C. has been the scene of several battles; Bolivar and Paez here defeated the Spaniards under Morales, February 3, 1820, and again under La Torre, June 24, 1821.

Calab'ria, the S.W. peninsula of the kingdom of Italy, comprises the provinces of Cosenza, Catanzaro, and Reggio, and has a length of some 160 miles, with a breadth varying from 18 to 70. Area, 1500 sq. miles; pop. (1871) 1,206,302. C. is traversed by the southerly ridge of the Apennines, which sends down several wild torrents, but no rivers of magnitude. The valleys and plains are singularly fertile, and there is abundance of excellent pasture. C. supports large numbers of sheep, horned cattle, and fine horses. The chief products are oil, wine, grain, rice, hemp, cotton, flax, saffron, manna, honey, silk, and southern fruits. The sides of the Apennines are clad with dense forests of oak, beech, larch, pine, plantane, and aloes. Along the coasts there are fisheries of tunny, coral, and anchovy. C. is also rich in iron, copper, gypsum, antimony, alabaster, and marble. The climate is delightful, but during the hot season there is malaria in some parts; earthquakes occasionally happen. Among the chief towns are Reggio, Rossano, and Monteleone. A railway round the S. and E. coast, from Reggio to Taranto, is now for the most part in operation. In ancient times the S.E. promontory of Italy was called C., from being inhabited by the Calabri, a tribe first mentioned by Polybius under that name, but supposed to be identical with the Messapians, and to be of Hellenic origin. The modern C. has long been infested by banditti, and almost the only outstanding fact in the history of the country is the fierce massacre (1560) of a Waldensian colony, settled here in 1340. The Calabrians are sprightly and high-spirited, but vindictive.

Calad'ium. See COCCO.

Calaguala, the rhizome of *Acrostichum Huacaro*, or 'little cord,' which is used in Peru as a sudorific, diuretic febrifuge, and anti-venereal. The rhizome of *Polypodium C.*, the slender or genuine C., and those of *P. crassifolium*, the thick C. or deer's-tongue, are also reported to have the same properties.

Calahorra (a Span. corruption of the Arab. *Kalat-harrah*, 'the stone-castle'), a town in the province of Logroño, Spain, on the Cidacos, a tributary of the Ebro. It is on the site of the ancient *Calagurris*, and has an old cathedral with a façade of brick. Quintilian was born here, and, according to some, Aulus Prudentius, the first Christian poet. The surrounding district is fertile, producing in abundance corn and fruits.

Calais (Celt. *cala*, 'a port or harbour'), a seaport and fortress of the first class, in the department of Pas-de-Calais, France, 30 miles N.E. of Boulogne, and 120 N.N.W. of Paris, with which places it is connected by railway. It is the great port of debarkation for English travellers entering France, and is becoming a manufacturing place of importance. The most noteworthy edifices are the Cathedral, which contains Vandyck's painting of the 'Assumption,' the *Hôtel de Ville*, built in 1740, and the *Hôtel Dessein*, which comprises a hotel, a theatre, a garden, and public baths. The citadel, which is on the W. side, commands the town and harbour, and the flat ground on the S. and E. can be laid under water at pleasure. The principal manufactures are bobbin-net and hosiery, and there are oil and soap works, tanneries, salt-refineries, distilleries, and shipbuilding yards. The harbour, formed by two moles, with continuations of wooden piers seawards, is nearly dry at ebb tide, and at high water has a depth of from 15 to 18 feet. It admits vessels of 600 tons, and has a floating dock and three lighthouses. The exports are chiefly horses, wine, linens, cottons, silks, and salted provisions. Their total value in 1873 was £3,836,000; the total value of the imports in the same year was £4,632,000. Pop. (1872) 11,554. C.'s history cannot be traced beyond the middle ages. Up to the 13th c. it was called *Scalas*. About that time it was fortified. Edward III. of England took C. in 1347, after a siege of eleven months, and his sparing the lives of the six heroic citizens, at the instance of Queen Philippa, is one of the best-known and most touching incidents in history. C. remained in the possession of England till its capture in 1558 by the Duc de Guise, since when its history has been purely French.

Calaman'der Wood, a cabinet wood resembling rosewood, but more durable and beautiful than it. It is produced by the *Diospyros quasita*, a species of the ebony genus (see *DIOSPYROS*), a native of S.E. India and of Ceylon. It is now getting scarce. It is very dense, and takes a beautiful polish. The name is most probably a corruption of Coromandel wood.

Calamary, or **Squid** (*Loligo*). A common and familiar example of this genus of 'two-gilled' or *Dibranchiate* cuttlefishes (see *CEPHALOPODA*) is the *Loligo vulgaris* or common squid, an organism frequently cast up in numbers on the British coasts. These forms belong to the family *Teuthida*, in which there are ten arms, two being larger than the others, while the fourth left arm in the males becomes a *Hectocotylus* (q. v.) to subserve reproduction. The shell exists as an internal horny *pen* or *gladius*, and several of these may be developed in one individual. Terminal fins exist, and the suckers of the arms are *pedunculated*, or provided with short stalks. The C. squid is largely used for bait; and several other species of C. are known, such as *L. media*, *L. marmora*, &c.

Calamian'nes, the name of an island and of a group of islands in the Philippines, S.E. of Luzon. The island, from which the group takes its name, is 35 miles long and 15 broad, is fertile, mountainous, and abounding in animal life. There is also a province called C. in the adjacent island of Palawan, which has a pop. (1871) of 27,189.

Calamine. There are two distinct minerals which bear this name. The one is a hydrated silicate of zinc, having the composition represented by the formula $ZnOH_2OSiO_3$, and is often called *prismatic* or *electric C.* The other is carbonate of zinc ($ZnCO_3$), and is also called *Smithsonite*.

Calamint, the French name, now naturalised in the English language, for *Calamintha officinalis*, a plant of the natural order *Labiata*. *C. officinalis*, *C. Nepeta*, and *C. sylvatica* are

aromatic plants to which extraordinary virtues were once ascribed. They are sometimes used as materials for tea. *C. Acinos*, or basil thyme, is a low, shrubby plant, the leaves of which are fragrant and aromatic. *C. Clinopodium*, the wild basil, is also aromatic.

Calamites, a genus of fossil plants found in various formations, from the Devonian to the Oolite, but attaining its maximum in the carboniferous, in which more than forty species have been discovered. They have been very commonly described as allied to *Equisetaceae* (q. v.), an opinion in which Carruthers and Schimper still coincide, but Hooker long ago showed that this view was erroneous—some of the most characteristic points of the structure of the horse-tails, such as the siliceous stomata, circle of teeth of the leaves at the joints, are wanting in the C. This botanist considered that they were allied to the ferns or to the club-mosses. On the other hand, Brongniart classed some of them among the Gymnospermous Dicotyledons, and others among the Equisetaceae, in which view he is followed by Dawson and others. Professor Williamson, of Manchester, the latest investigator of these plants, considers that he has clearly made out that they are exogenous in structure. 'The plant possessed three distinct concentric layers of tissues, a central pith, surrounded by a ligneous zone, which in its turn was invested by a thick cortical or epidermal cellular structure.' The Calamitean literature is extensive, but perhaps the fullest account may be found in Williamson's *Organisation of the Fossil Plants of the Coal Measures*, Part 1., Calamites, *Philosophical Transactions*, 1872.

Cal'amus, the reed-pen used by the ancients in writing. The best kinds of reed for this purpose were got from Egypt and Cnidus. They were cut and split with a knife as quills are with us, and when blunt they were also sharpened with a knife. This process was by the Romans called 'tempering.'

Calamus, a genus of palms. See RATTAN, DRAGON'S BLOOD, and CANE.

Calamus Aromaticus, a name given by the ancients to a plant which is probably *Andropogon calamus aromaticus*, which yields the grass-oil of India. (See LEMON GRASS.) The name *Calamus* is also sometimes applied to the sweet flag (*Acorus calamus*), and it is believed that the sweet calamus and cane of the Bible (Exod. xxx. 23, and Jer. vi. 20) are identical with the C. A. of the Greeks and Romans.

Cal'amy, Edmund, an English divine and Presbyterian apologist, was born in London in 1600, studied at Cambridge, and, after being for a time domestic chaplain to the Bishop of Ely, threw himself into the controversy between Presbyterians and Episcopalians, adopting the side of the former, and having, it is believed, a considerable share in the authorship of the celebrated polemic pamphlet *Smectymnus* (q. v.). C., however, was opposed to republicanism and the execution of Charles I., and would have obtained a bishopric after the Restoration had he been willing to accept it. He, however, took the post of royal chaplain, but soon resigned it for conscientious reasons. He died October 29, 1666. His eldest son, Edmund, was ejected from his living of Moreton for nonconformity, and died in 1685. His second son, Benjamin, became an eminent High Church divine and pamphleteer, and died in 1686, prebendary of St Paul's. Edmund had a son, also named Edmund, born in 1671, and commonly known as the Younger, who distinguished himself as a nonconformist theologian and controversialist. Among his works is a series of biographies of ministers and others ejected after the Restoration by, or before, the Act of Uniformity. In 1709 he visited Scotland, and had the degree of D.D. conferred upon him by the Universities of Edinburgh, Glasgow, and Aberdeen. He died June 3, 1732.

Calan'do, in music, an expression mark denoting a gradual decrease in loudness, accompanied by some slackening of the time.

Calan'dra. See CORN WEEVIL.

Calandrin'ia, a genus of plants belonging to the Purslane order (*Portulacaceae*), several of which are cultivated—e.g., *C. umbellata* from Chili, *C. speciosa* from California, &c.

Calandro'ne, a simple reed instrument used by Italian peasants.

Oal'as, Jean, a victim of religious fanaticism, who has a permanent place in history, belonged to a Huguenot family in Languedoc, and was born in 1698. He married an Englishwoman, and followed the trade of a merchant in Toulouse. One night in the month of October 1761, his eldest son, Marc Antoine (a Catholic), was found dead (by hanging) at the shop door. The excited religious feeling of the town compelled the trial of the whole family, and secured the condemnation of C. to the wheel, which he underwent 9th March 1762. His widow fled into Switzerland, where she told her story to Voltaire. By his exertions the iniquitous sentence of the local 'Parlement' was reversed on appeal (1766), and a large sum in compensation paid to the family. The process was a striking illustration, not only of religious intolerance, but of the defects of French criminal procedure. It forms the text of the sequel to Voltaire's essay *Sur la Tolérance*. A large collection of interesting documents connected with the case will be found in the 36th volume of his collected works. There is little doubt that young C. committed suicide. Toulouse was soon after disgraced by the *Affaire Sirven*.

Oalassa'ya Bark. See CINCHONA.

Oalatafimi, a town in the province of Trapani, Sicily, 28 miles S.W. of Palermo, has a remarkable mosaic altar in the church of Sta. Croce. The place, which derives its name from the Arabs (*Kalat-al-Fimi*), was taken by them in 828, and long remained in their possession. It was the scene of a victory gained by Garibaldi over the Neapolitans, May 15, 1860. Pop. 8780.

Oalatagiro'ne, or **Oaltagirone**, a growing town of Sicily, province of Catania, lies in the Val di Noto, 22 miles N.N.W. of Ragusa; has active manufactures, chiefly of cottons and earthenware. Pop. (1872) 25,978.

Oalataascibett'a, or **Oalascibett'a**, a town of Sicily, in the province of Caltanissetta, about 46 miles W. of Catania, and near the line of railway from that city to the interior. It was founded in 1080, has an old church, and commands a fine view. Pop. about 5000. The name is of Arabic origin, and means the *castle of Saïd* or *Xibth*.

Oalatayud', a city of Aragon, Spain, on the Jalon, 48 miles S.W. of Saragossa. It is of Moorish origin, and was built out of the remains of ancient *Bilbilis* by Ayub (Job), the nephew of Musa, hence the name—C. signifying in Arabic the *castle of Ayub*. The castle gives the town, otherwise dilapidated, an imposing look. C. has woollen, linen, and hempen manufactures. Pop. about 11,000. The environs are fertile, and irrigation produces excellent pasture.

Oalathid'ium, **Oal'athus**, **Oalathid'ia**, a head of flowers, such as that of the dandelion and other *Compositæ* (q. v.). It is the same as a *Capitulum*.

Oalatra'va, Knights of, a Spanish order instituted at Calatrava in 1158, whose original costume consisted of a coat of white mail, with a white scapulary, a black hat, and a pilgrim's hood. At present their costume is a white mantle, with a red cross cut out in the form of lilies on the left breast, while the cross of the order has the same symbol on a silver ground. Their statutes were framed by the Chapter-General of the Cistercian monks, sanctioned in 1164 by the Bishop of Toledo, and afterwards by the Pope. They acquired great influence by the privileges conferred on them, by the lands which they wrested from the Moors in Spain and Portugal, and by the fact that their grand-masters were always chosen from the highest families in Spain. The K. of C. suffered a severe defeat in 1197 from the Emir Jakub-ben-Yussef, when nearly the whole order was destroyed, and Calatrava was taken by the Moors. The remnant removed to Salvatierra. The victory of Las Navas de Tolosa, however, in 1212, once more brightened the fortunes of the Christian cause. At last, falling under the jealousy of the crown, two of the knights were executed for treason; and, on the death of the thirteenth grand-master in 1489, the administration of the order was transferred to the king by a bull of Pope Innocent VIII., and in 1523 the grand-mastership was formally united to the Spanish crown. Since 1808 the order, whose great wealth has long vanished, has been simply an order of merit.

Calatrava la Vieja, a ruined city of Spain, province of Ciudad Real, on the S. bank of the Guadiana, 12 miles N.E. of Ciudad Real, was in the middle ages a strongly fortified town. It was called *La Vieja* ('the old') to distinguish it from the convent of the Knights of C., built in 1214, and called *C. la Nueva* ('the new').

Calcareous substances contain lime or salts of calcium as their principal constituent. C. waters contain chalk or carbonate of calcium (CaCO_3), dissolved by excess of carbonic acid (CO_2). Such waters are hard, but they lose their hardness when boiled (temporary hardness), owing to the loss of carbonic acid and the precipitation of chalk.

Calcareous Spar, or **Calc Spar** (Lat. *calc.*, 'lime'), native carbonate of lime, crystallized in a great diversity of forms, derived from an obtuse rhombohedron. When pure it is colourless, but frequently it assumes a grey, yellow, green, red, or brown colour, from the admixture of iron, magnesia, chrome, and other impurities. It has usually a vitreous, sometimes an earthy, lustre; in density it ranges from 2.5 to 2.72, and in hardness from 2.5 to 3.5 Mohs. *Iceland spar*, so called from the finest specimens being obtained from the E. coast of Iceland, is one of the purest varieties of C. S., and crystals of it exhibit the optical phenomenon of the double refraction of light in a remarkable manner. C. S. is most extensively and widely distributed, being one of the most abundant minerals. The mines of Derbyshire, Devonshire, and Cornwall, in England, and that of Andreasberg, in the Harz, yield most beautiful crystals.

Calcareous Tufa, or **Calc Tuff**, a soft porous variety of carbonate of lime deposited from solution in water. It is found in tubular, botryoidal, and other amorphous masses, sometimes incrusting organic remains, and varying in colour from grey to brown, with a predominating tinge of yellow. Considerable deposits occur near Brunswick, at Blakenwell in Dorsetshire, and in the Roman aqueducts from the heights of the Eifel to Cologne and Trier. *Travertine*, a harder and less friable variety, occurring on the banks of the Tiber, is used at Rome as a building material.

Calceola'ria, a genus of plants belonging to the natural order *Scrophulariaceæ*, distinguished by the beauty of their flowers, the corollas of which are roughly slipper-shaped, hence the name (*calceolarius*, Lat. 'a shoemaker,' or *calceolus*, 'a little shoe'). They are natives of S. America, and are found only on the western slope of the Andes, or on the southern extremity of the mainland and adjacent islands, either near the sea or at a great height on the mountains. *C. floribunda*, for example, is found in the vicinity of Quito at an elevation of 11,000 feet above the sea-level. Others are found near the sea-shore in the Falkland Islands, *C. Polakowskii*, of Port Famine, is among the prettiest of its genus. Many are cultivated in our gardens; and by crossing them a variety of forms have been obtained, so that the original pure species are getting rather uncommon. In S. America the roots of *C. arachnoidea*, the original of many of our garden hybrids, are employed (under the name of *Relbun*) for dyeing woollen cloth of a crimson colour. All the species are easily propagated by cuttings, and require frequent watering.

Calcina'tion is the process of heating to a high temperature, or roasting, by which substances are made to yield up volatile constituents, or are oxidised. The word is evidently derived from the process of lime-burning.

Cal'cium is a metal whose compounds are widely distributed and abundant. Chalk, limestone, arragonite, marble, and Iceland spar are carbonate of C., anhydrite and gypsum its sulphate, fluor-spar its fluoride, and bone-ash and apatite its phosphate. The metal was first isolated by Sir Humphrey Davy in 1808, who obtained it, amalgamated with mercury, by the action of the electric current on a mixture of moistened slaked lime and oxide of mercury. On heating the amalgam obtained in this manner, metallic C. remained, whilst the mercury passed off in the state of vapour. The metal is produced more readily, and in larger quantities, by the action of the electric current on a mixture of the chlorides of C., strontium, and ammonium. C. is a pale yellow metal, malleable, ductile, and very light (sp. gr. 1.578). It decomposes water at ordinary temperatures, liberating hydrogen, and combining with oxygen and water to form slaked lime. It readily oxidises in the air, and if heated burns with a very in-

tense light. The atomic weight of C. is 40, and the symbol for its atom Ca. C., together with barium, strontium, and magnesium, forms a group called metals of the alkaline earths. See LIME.

Calcott, Sir Augustus Wall, B.A., born at Kensington, 1779, was for some time a chorister in Westminster Abbey, commenced painting at an early age, first exhibited at the Royal Academy in 1799, and was soon recognised as one of the best painters of English coast and rural scenery. He was admitted R.A. in 1810, travelled in Italy in 1827, and afterwards chiefly affected Italian subjects; exhibited his 'Raffaello and the Fornarina' in 1837, and in the same year was appointed surveyor of H.M. pictures, and knighted. C. died 25th November 1844.

Calcott, John Wall, a distinguished English musician, born in 1766. He obtained the degree of Bachelor of Music at Oxford at the age of nineteen, and a few years afterwards that of Doctor. In 1805 he published a musical grammar; but his mind shortly afterwards gave way through overwork, and, with a short interval, he continued insane until his death in 1821. Some of his glees, as *In the Lonely Vale of Streams*, *O Snatch me Swift*, *To all you Ladies*, &c., are still well known.

Calculating Machines are daily becoming more and more necessary to the professional calculator, especially in connection with nautical and mathematical tables and the reduction of astronomical observations. The first instrument of this kind was invented by Pascal, and after his we have the inventions of L'Epine, Leibnitz, Polenus of Padua, Hahn of Wurtemberg, and Müller of Hesse-Darmstadt. M. Thomas' *Arithmètre* is very generally known, and is exceedingly useful in the calculation of results dependent upon the operations of multiplication and division. MM. G. and E. Scheutz of Stockholm have constructed a large machine for the evolution of any series the law of the formation of whose terms can be intrusted to it. Most deserving of notice, however, are the wonderful inventions of the late Sir Charles Babbage. During the construction, by the aid of Government, of his *Difference Engine*—a machine capable of managing series the differences of whose terms did not become zero till the seventh order of differences was reached—he was led to the conception of his *Analytical Engine*, which, being able to perform directly the operations of addition, subtraction, multiplication, and division, in any order the operator may please, can therefore deduce any result, however complex the operations in the calculation may be. It is to be regretted that Government did not take in hand this later development, or even continue the construction of the less costly *Difference Engine*, which is now lying an unfinished curiosity in the museum of King's College, London. Grant's *Difference Engine*, now being constructed for the University of Pennsylvania, is said to be less costly than Babbage's, and less complicated than Scheutz's, though, like the latter, it is furnished with an apparatus for printing the results it evolves. Of a different type of C. M. are the *planimeters*, or instruments for measuring the areas of plane figures. Of these the *Polar-planimeter* of Amsler-Lasson of Schaffhausen is the simplest in construction.

Calculus, or Stone, in medicine, the name given to a Concretion (q. v.) formed in the animal body of the consistence of stone. C. is chiefly formed of materials which are usually held in solution in one of the fluids of the body. C. is of two kinds, biliary and urinary; the former found in the gall-bladder or bile-ducts, the latter in the kidney or bladder.

1. **Biliary Calculi**, or gall-stones, are more frequently formed in the gall-bladder than in the substance of the liver. They consist chiefly of Cholestrine (q. v.), colouring matter, salts of lime, and magnesium, together with the acids of the bile and of fats. When single they are round or pear-shaped, sometimes resembling peppercorns; when more than one gall-stone are found in the gall-bladder, they generally have facets formed by

Calculus.

pressing and rubbing against each other. Biliary C. may exist in the gall-bladder without causing pain or inconvenience, but when one enters into the bile-duct it gives rise to incessant pain. This pain is felt most under the ribs on the right side, and is often accompanied by vomiting. If the stone remains impacted in the passage, jaundice is the result, and sometimes ulceration and death. If the stone finds its way into the bowel, the pain ceases, and the patient finds instant relief. Treatment consists in alleviating the pain with opiates internally, with poultices and hot fomentations externally.

2. **Urinary Calculi**.—These may be found in the kidney or bladder, hence called renal or vesical accordingly. Renal calculi are formed in the kidney, and generally consist of uric acid or oxalate of lime. This gives rise to severe pain in the loins, especially when the C. leaves the kidney and enters the Ureter (q. v.). The pain as it passes along this narrow tube is most intense, and is to be alleviated by opiates and hot fomentations. When such a C. reaches the bladder pain ceases, and the C. may be expelled with the urine, or it may remain in the bladder and become the nucleus of a vesical C., gradually becoming larger and larger by successive deposits of various salts; and thus, when cut into parts, a C. is often found to be composed of successive layers of earthy matters, forming what has been called *alternating C.* Sometimes the C. begins in the bladder by simple aggregation of small granules or gravel, and at other times, a foreign body introduced into the bladder forms the nucleus of the C. Not much is known regarding the origin of C. In some countries it prevails more than in others. It exists at all ages, from birth to old age. Sometimes C. exists without causing much inconvenience; generally, however, it gives rise to certain well-marked symptoms, of which the chief are gravel, severe attacks of pain in the region of the bladder, called 'fits of the stone,' aggravated by exercise, frequent passing of urine, and occasional stopping of the flow of urine during the act of micturition. By the introduction of a metal instrument into the bladder, called a 'sound,' the surgeon can detect the presence of a C. in the bladder. Treatment in the early stage consists in attention to diet; and, having ascertained by the microscope and by chemical tests the kind of C. or gravel present in the bladder, giving such medicines as will remedy the kind of gravel present in the urine. When the stone is too large to be passed by the Urethra (q. v.), it must be removed by Lithotomy (q. v.) or by Lithotripsy (q. v.). Frequently it is necessary to give opium or belladonna to relieve the pain caused by a C. Calculi vary in size from a small pea to a large orange. They have been classified according to their chemical composition into—(1) Uric acid C., by far the most common kind; contains also a little urate of ammonia. (2) Urate of ammonia C. This is a rare C., and is found only in children. (3) Mulberry C., so called from its resemblance to a mulberry, is composed chiefly of oxalate of lime, is very hard, forms slowly, and is always single. (4) Carbonate of lime C. is rare in man, but is frequent in the lower animals. (5) Fusible C., consisting of phosphates of lime, magnesium, and ammonia, is often large and very friable. (6) Cystic oxide C. is very rare, and consists chiefly of cystine, a peculiar waxy-looking transparent substance, which crystallises in hexagonal plates; and (7) Xanthic oxide C. This is the rarest of all calculi. See URINE.

Animals, and especially sheep, fed largely on beetroot and oilcake, are liable to an affection of this kind, which, if not attended to, finally closes up the urinary passage, and occasions death.

Calculus, Differential and Integral, unquestionably the widest and most important branch of mathematics, embracing as it does all the higher and more difficult developments and applications of Algebra (q. v.). As the heading implies, it consists of two divisions, distinctly separated—the one in fact being the inverse of the other. The *Differential C.* is concerned with the conception and investigation of certain *derivatives* obtained from their *primitives* according to some general principle; the *Integral C.*, on the contrary, endeavours, from the specified relations subsisting between these derivatives, to deduce, by strict mathematical processes, relations which hold between the primitives. The peculiar ideas involved in this C. were foreshadowed by Archimedes and other ancient geometers in their method of exhaustions (see EXHAUSTIONS, &c.); but their ignorance of

algebra greatly restrained their investigations. It remained for Newton and Leibnitz to establish, about the same time, and quite independently of each other, this invaluable method of analysis. Newton's conception was a kinematical one—i.e., he investigated the *rate* at which a given function of a continuously increasing variable increased or decreased (see FLUXIONS); and in the first section of the *Principia* he established the same on a firm geometric basis (see RATIOS, PRIME AND ULTIMATE). Leibnitz, again, investigated the increase or decrease which the same function suffered when the independent variable received an *infinitely small* increment. His method, however, bears the stamp of mere *approximation*, for he took account only of the term containing the *first* power of the increment, the others being proportionally inappreciable and neglected in consequence. A simple example will show the difference between these two ways of treatment. Let $y = x^3$; let x become $(x + \Delta x)$, where Δx is an infinitely small quantity; y then becomes $y + \Delta y = (x + \Delta x)^3 = x^3 + 3x^2\Delta x + 3x(\Delta x)^2 + (\Delta x)^3$, hence $\Delta y = 3x^2\Delta x + 3x(\Delta x)^2 + (\Delta x)^3$ according to Leibnitz; $(\Delta x)^2$ and $(\Delta x)^3$ being inappreciable. The expressions Δy and Δx are the *differentials* of y and x respectively. Following Newton now, let us suppose x to receive *any* increment Δx ; then

$$y + \Delta y = (x + \Delta x)^3 = x^3 + 3x^2\Delta x + 3x(\Delta x)^2 + (\Delta x)^3$$

therefore $\Delta y = 3x^2\Delta x + 3x(\Delta x)^2 + (\Delta x)^3$

or $\frac{\Delta y}{\Delta x} = 3x^2 + 3x\Delta x + (\Delta x)^2$.

Now find the *limiting* value of this expression as Δx diminishes towards zero; and thus we get the *differential co-efficient* of y with respect to x , or $\frac{dy}{dx} = \lim_{\Delta x \rightarrow 0} \frac{\Delta y}{\Delta x}$ (as Δx tends to zero) $= 3x^2$ ultimately. This result bears a great resemblance to the *differential* form; but it must be observed that $\frac{dy}{dx}$ is *not* a fraction—

it is the limit of a fraction. Lagrange, however, was dissatisfied with both of these methods, and gave another in his *Théorie des Fonctions*, which nevertheless contains implicitly the idea of *limits*, the one objection to Newton's reasoning. He assumed to have demonstrated that any function $\phi(x + h)$ can be expanded in an infinite series, in ascending powers of h , or

$$\phi(x + h) = \phi x + A_1 h + A_2 h^2 + A_3 h^3 + \dots$$

where A_1, A_2, A_3, \dots are functions of x only; and these he termed respectively the *first, second, third, &c.*, derived functions of ϕx . They correspond to the 1st, 2d, 3d, &c., differential co-efficients of ϕx with respect to x . The 2d differential co-efficient of y is $\frac{d}{dx} \cdot \frac{dy}{dx}$ or $\frac{d^2 y}{dx^2}$ as it is written; and so on up to $\frac{d^n y}{dx^n}$.

The *Integral C.*, the inverse operation, has not been nearly so rapidly or completely developed as the *Differential*. It is of the nature of a *summation*, a fact still evident by the symbol of integration, which is a modification of the Old English Σ . It is entirely to the elder Bernoulli (q.v.) that we are indebted for the first systematic treatment of this part of the subject, in which they far outstripped Leibnitz himself. The general problem may be thus stated:—Required ϕx , such that its differential co-efficient may be the given and known $\phi'x$. The usual notation is $\phi x = \int \phi'x \, dx$. Simple as it may appear thus put, its difficulties are such as to be in many cases insurmountable, the integrable functions being few in comparison to the non-integrable. We cannot here enter into the various methods and artifices employed, for which we refer to the many excellent treatises on the subject, such as De Morgan's *Differential and Integral Calculus*, Todhunter's, Williamson's, Hall's, &c. See DIFFERENCES, DIFFERENTIAL EQUATIONS, FUNCTIONS, VARIATIONS, &c., for the more special departments of the C.

Calcutt's (from *Kali Ghatto*, i.e., the goddess Kali's *ghaut* or landing-place), the metropolis of British India, and capital of the province of Bengal, lies on the left bank of the Hoogly, 100 miles above its entrance into the Bay of Bengal. It is the residence of the Governor-General of India, and the Lieutenant-Governor of Bengal's official residence, Belvedere, is in the suburb of Alipore. It is the seat of the Government of all India, of the High Court of Justice, and of the Bengal Court

of Appeal; while, as the greatest Eastern commercial centre, it does one-third of the whole trade of India. C. extends over an area of 8 sq. miles, stretches some 5 miles along the river, is now lighted with gas, has an extensive drainage system, and receives a water-supply superior to that of London and equal to that of Glasgow. It has been called 'the city of palaces,' on account of its numerous fine buildings, of which the chief are the Government House, on the Maidan Esplanade ('the Hyde Park of India'); the Bishop's College, a fine Gothic building; the Town-hall, the Post-office, and the Mint, facing the river; the High Court, the University Museum, the Medical College, the Bank of Bengal, the Bengal Club, and the Cathedral. There are, besides, many other handsome buildings, comprising Hindu temples and Christian churches, but the mosques and Parsee fire-temple are mean. C. has a university, founded in 1857, on the plan of London University; the Bethune Society, intended to promote intercourse between natives and Europeans; a Dalhousie Literary Institute; the Bengal Asiatic Society, with a valuable library; the Government Presidency College, founded in 1824; the Free Church, General Assembly's, Cathedral Mission, London Missionary Society's, and Jesuits' Colleges, for the education of Christian teachers and native students; four first-class medical hospitals; and various educational institutions of a high character. It has twenty-three daily, weekly, and monthly newspapers, of which only five are in English; and nineteen magazines, of which several are native. Adjoining the river is the only defence of C., Fort William, the largest stronghold in India, the erection of which cost £2,000,000. The native portion of the town, despite recent improvements, is still miserable, the houses being constructed mainly of mud, mats, and bamboo. Many of these frail houses were destroyed by successive cyclones, and have been replaced by brick buildings. The cost of living in C. is cheap for India, and is not much in excess of that of European cities. There are abundance of handsome and well-stocked shops and bazaars. The principal manufactures are jute, gunny-cloth, oil, cotton, and sugar. The jute industry has rapidly developed of late years, and a great number of large power-mills have sprung up in C. and the neighbouring villages. The mills of Barnagore alone employ (1873) 17 European assistants and some 4700 natives, and yearly manufacture over 16,000 tons of jute into gunny-bags. In 1874 there were three large cotton-mills, each employing about 300 persons, and turning out yarn and cotton-thread largely for local use. There are also extensive flour and saw mills and shipbuilding yards. Among the chief exports are raw jute (in 1872-73, 7,080,912 cwts., worth £4,142,547), raw cotton (£4,000,000 yearly), indigo, opium, silk (9000 bales), tea, saltpetre, linseed, and indiarubber. In 1872-73 the value of gunny-bags, cloth, twine, and rope exported was £835,911. The trade in tea is steadily increasing, the value of the export for 1873-74 being £1,692,699, and the yield in Bengal for 1874 reaching 23,500,000 lbs. The total annual value of the foreign trade is about £40,000,000 sterling, of which nearly two-thirds is in exports, and rather more than one-third in imports, including treasure. The inland, river, and coasting trade is enormous, but statistics have hitherto failed to register it. The river at C. is nearly a mile wide, and is navigable for ships of 2000 tons. In 1872-73 there entered the port 1118 vessels of 992,211 tons, of which 342 were steamers, 161 native craft, and 91 Suez Canal steamers. C. has now railway communication with the N.W. Province, Bombay, and the junction of the Ganges with the Brahmapootra, on the way to Assam; while it has telegraphic lines to all the chief towns of India and Australia, and to Europe. It has become much more healthy of late years, a result greatly due to its receiving an effective drainage and a splendid water-supply in 1858. The water is now taken from the Hoogly, some 15 miles above the city. The mean temperatures of C. in December and May are 68° 5' and 85° respectively. The average rainfall is 66 inches, while the highest on record is that of 1871, when it reached 93° 61 inches. Pop. (1872) 447,601, of whom 291,194 were Hindus, 133,131 Mohammedans, 869 Buddhists, 7265 Europeans, 12,315 mixed classes, and 1776 native Christians. The addition of the suburbs, comprising Chitpore, Sealdah, Bhowanipore, Alipore, Kidderpore, and, on the opposite side of the river, Salkesh, Howra, and Seebpore, brings the pop. of C. up to 892,429, under three municipal corporations. The dominant native language is Bengalee, but English is used by a vast number of educated natives. In 1686 a

factory of the East India Company was established here by Governor Charnock, and in 1700 three adjoining villages were presented to the Company by the Emperor of Delhi. The settlement was then fortified, and called Fort-William in honour of the then King of England, but subsequently it received its present name, which had been that of one of the villages. C. was made the capital of a presidency in 1707, but it first figures in history in connection with the events of 1756. In that year it was attacked suddenly by Surajah Dowlah, and after a stout siege was shamefully deserted by the officers on duty. In two days more, disturbances within the town itself led to its surrender. Then followed the fearful tragedy of the Black Hole, when 146 English captives were forced into a room only 20 feet square, to pass one of the hottest nights of an Indian summer. On the following morning it was found that there barely survived twenty-three of the number. Eight months later, Clive and Admiral Watson rescued C., which soon afterwards entered on its modern career of prosperity. It was formed into a municipality after the Mutiny, having a body of commissioners, comprising the justices and a chairman named by Government. The actual income of the municipality at present is £270,000 (the nominal, £507,298), and its expenditure £436,108, while it has already a debt of £1,400,000, and a sinking fund for the payment of loans. In the course of his Indian tour, the Prince of Wales visited C. (27th December 1875 to 3d January 1876), where he met with a magnificent reception.

Cal'das, or **Calde'tas** (Lat. *calidus*, 'warm'), a name given to several places in Spain and Portugal where there are hot mineral springs, as *Las C. de Montibuy*, *Las C. de Malavella*, *Las C. de Rainbas*, &c. Colonists from the Peninsula have applied the word to corresponding localities in S. America.

Cal'der, a river in the W. Riding of Yorkshire, rises near Burnley; in Lancashire, and flows E. through the valley of Todmorden. At Wakefield it turns to the N.E., and after a course of 40 miles falls at Castleford into the Aire. As numerous canals are connected with the C., it is of great importance in the inland system of navigation through Yorkshire and Lancashire.

Cal'deron, **Don Pedro de la Barca**, a famous Spanish poet of noble family, was born at Madrid, 17th January 1600. He was educated at the Jesuits' Royal College there and at Salamanca University, served in the Spanish army of Flanders and Italy for ten years, became (after the death of Lope de Vega in 1635) superintendent of court theatricals to Philip IV., served also in the Catalonian campaign of 1640, took religious orders in 1651, and died 25th May 1681, chaplain of the congregation of San Pedro, Madrid. From the age of fourteen, while in the army, and after joining the Church, C. was engaged in dramatic composition. He left 120 comedias (of three acts each), 200 *loas* or prologues, 100 *autos sacramentales* (sacred allegories), 100 *saynates* (humorous interludes), and many poems, songs, and romances. By the Schlegels and other German critics, C. has been placed among the first of dramatists; but Goethe's opinion that he is 'great in the technical and the theatrical' is more generally accepted. Skillful plot, bursts of passion, comic situations, a musical versification, are to be found in his plays; but he is 'the poet of the Inquisition,' without philosophy, moral enthusiasm, or deep sympathy with nature. *The Wonderful Magician* (in which Cyprian and Justina have parts like those of Faust and Gretchen), and *Life is a Dream* (translated into English by Oxenford), are the best known of his philosophical plays. Among tragedies (in which, however, the comic element is never wholly wanting), *The Physician of his own Honour* and *Jealousy the Greatest Monster* may be mentioned. The heroes, Don Gutierre and Tetrarch Herod, have been unjustly compared with Othello; but, with the suspicious Spaniard, jealousy is more a question of honour than of love. The independent peasant Crespo, and the amusing poor hidalgo Don Mendo, in *The Alcalde of Zalamea*, are also among C.'s best characters, although his intriguing comedies (called in Spanish, 'comedies of mantle and sword'), such as *The Secret in Words*, with the amusing Gracioso, or humorous valet, have been most successful. C. has left powerful historical plays, such as *The Constant Prince*, *Ferdinand of Portugal*, a Moorish story, which became popular on the German stage, and others on religious subjects, such as *The Devotion of the Cross*, and the *Pur-*

gatory of St. Patricius, in which the Catholic faith saves the most accomplished villains from their proper punishment. The best edition of C. is that of Hartzenbusch (4 vols. Mad. 1848-50). See Sismondi's *Hist. of Lit.* (vol. ii.); G. H. Lewes' *Spanish Drama*; French's *Life and Genius of C.* Two volumes of English translations have been published by M'Carthy.

Calderon, **Don Seraphin-Estevan**, a modern Spanish poet, born 1801, at Malaga, was a distinguished student at the University of Granada, where, in 1822, he was appointed Professor of Poetry and Rhetoric. His *Poesias del Solitario* (Mad. 1833) were published anonymously, were well received, and were surpassed by a second volume published in 1840. His articles on Andalusian manners, contributed about this time to a literary periodical (*Cortas Españolas*), are full of truth and humour. In 1834 C. was appointed auditor of the Army of the North, and in 1836 civil governor of Logrono. His literary employments at this time were the translation of Bonnin's *Principes d'Administration*, and the study of Arabic literature. Forced to return to Madrid in 1836, he there edited a collection of ancient Spanish literature, and projected a great critical work on the *Cancioneros* and *Romanceros*. His *Christianos y Moriscos* (Christians and Moors) is a romance in the spirit and style of Cervantes, and printed in the *Collection de Novelas originales Españolas* (Mad. 1838). A later work is his *Escenas Andalusas* (1847).

Cal'derwood, **David**, a Scotch Presbyterian minister in the reign of James VI., was born about 1575. He became minister of Crailing, Roxburghshire, about 1604, and thereafter showed himself a keen opponent of Episcopacy. In 1617 he was imprisoned for contumacy, and only liberated on condition of leaving the kingdom. Accordingly, he went to Holland (1619), where, in 1623, he published a work, in which he attacked Episcopacy generally, and especially the attempt to obtrude it upon the Church of Scotland. On the death of James he returned to Scotland, and lived for some time in Edinburgh, collecting materials for a history of the Church of Scotland during the reign of James VI., which he left in MS. when he died in 1651, and which his descendants presented to the British Museum. The MS. was first printed by the Rev. Thomas Thomson for the Wodrow Society (8 vols. Edinb. 1842-43). It is a work indispensable to every thorough student of Scottish history.

Caldie'ro (Lat. *calidus*, 'warm'), a village in the province of Verona, N. Italy, 8 miles E. of Verona by railway. It is the *Caldarium* of the Romans, and was much frequented on account of its hot springs till the 16th c. Here the French, under Napoleon, were defeated by the Austrians led by Alvinzi, in 1796, and again, under Massena, by the Archduke Charles, in 1805. Pop. 1600.

Cal'ea, a genus of plants belonging to the natural order *Compositae*, natives of tropical America from Southern Brazil to Mexico. About thirty species are described. *C. Zacatechichi*, the 'Juralillo' of the Mexicans, yields in the fresh state a considerable quantity of camphor; the powdered leaves are applied to wounds, and the plant is used generally as a febrifuge. The leaves of *C. Jamaicensis*, when steeped in wine and brandy, are said to be used as a bitter stomachic in the W. Indies. Perhaps this account applies better to *Neurolema lobata* (*Treasury of Botany*).

Caledo'nia (popularly said to be a Latinised form of *Coil-doinne*, 'men of the woods'; but the first syllable may be a form of *gael*, and then the meaning might be 'Gaels of the dunes,' or hills), the name anciently given to the northern part of Scotland. The C. of Ptolemy probably lay between Loch Fyne and the Moray Firth; but the term seems to have been applied by the Romans to the whole country lying N. of the Wall of Antoninus. Tacitus speaks of the Caledonians as having large limbs and red hair, thence inferring that they were of Germanic origin; and Xiphilinus, in his epitome of Dion Cassius, says that they had neither walls nor cities, nor did they till the ground, but lived by pasturing cattle, by hunting, and on fruits. They were given to pillage and war, and fought from chariots with shields, spears, and daggers. Cn. Julius Agricola, the first Roman who encountered them, routed the united tribes under Galgacus at the *Mons Grampius*, 84 A.D. Their country, though overrun as far as the Moray Firth, was never reduced to a Roman province. In the Welsh poems and in Nennius the name is given to a region

south of the Forth. Arthur's seventh battle was fought in *silva Caledonia*, *id est, cuius coit Caledon* (in the wood of Caledon, i.e., the battle of the wood of Caledon). Gradually it ceased to be applied to a particular district; but it is still used, especially in poetry, to designate the whole of Scotland.

Caledonian Canal, a ship-canal formed by uniting a series of lakes in Glenmore ('the great glen') in Inverness-shire by a navigable channel. Its object is to save sailing vessels the tedious and even dangerous voyage round Cape Wrath, but it is now largely used also for passenger traffic, especially in the summer, between the E. and W. coast of Scotland. It was originally surveyed by Watt and Jessop about 1773, but was only commenced thirty years later by Telford, under whom it was executed. Its construction occupied twenty years. Its total length is 60½ miles, of which the canal proper is 23 miles, the remainder being supplied by Lochs Ness, Oich, and Lochy. The canal is 120 feet broad at the water surface, and 50 feet at the bottom, and has an average depth of 17 feet. Its rise is 94 feet, and it has 28 locks, each about 180 feet long and 40 feet wide. The tonnage rates paid to the canal during the year ending April 1873 amounted to £4713, the number of passages being 1885. The scenery of the C. C. itself is very picturesque, especially at its western end, where it joins the sea-loch, Loch Eil, only three or four miles from Ben Nevis, and in full view of its precipices; and still greater beauty is to be found in the glens which open into it upon the northern side, and which lead into some of the finest parts of Ross-shire.

Cal'endar (Lat. *calendarium*), the register of the days, weeks, and months of the year. The earliest division of the year was probably into summer and winter, to which spring and autumn were afterwards added. The earliest systematic mode of reckoning time, however, was derived from the changes and phases of the moon; hence the division into moons, or months, and weeks. To this was soon added the division into years determined by the motions of the sun. The discovery that the solar year did not contain an exact number of moons necessitated some system of accommodation. For this end different plans were resorted to by different nations. The Jewish year consisted of twelve lunar months, with a thirteenth introduced at intervals. In most of the Greek states, the year was composed of twelve lunar months at a rough average of thirty days each; but, as early as the time of Solon (594 B.C.), it was known that the lunar month contained only twenty-nine and a half days. Reckoning the months of thirty and twenty-nine days alternately, the Greeks adapted the lunar year of 354 days to the solar year, by the addition of a month of thirty days three times in every cycle of eight years, thus making the average length of the year 365½ days.

The Roman year originally had ten months of 304 days, which Numa increased by the addition of two months (January and February), making a year of 355 days. This year was corrected by the addition of a short intercalary month called *Mercedonius* or *Mercedinus*, and remained in force till Julius Cæsar in 46 B.C.—known as 'the year of confusion'—corrected the accumulated error by the addition of sixty-seven days over and above the usual intercalary month, and fixed the length of the year at 365½ days, consisting of twelve months, with the names and number of days they still retain. Thereafter the ordinary year consisted of 365 days, every fourth being reckoned a leap year of 366.

The Julian year being in excess of the true solar year by 11' 12", in the course of centuries the accumulated error became considerable. In 1582 A.D. it amounted to ten days, when Pope Gregory XIII., assisted by a number of learned men, again re-adjusted the C. The mode adopted was to strike out ten days from the year, reckoning the 5th October as the 15th, and to obviate the recurrence of the error, he ordained that every fourth hundredth year should remain bissextile, while the intermediate hundredths should not; in other words, that the centuries, divisible without remainder by 400, should alone of the centuries be accounted leap years. Thus 1600, 2000, 2400, would be leap years, but not 1700, 1800, 1900, 2100, &c.

The mean Gregorian year consists of 365 days, 5 hours, 49', 12", being only 24" more than the mean tropical year, or one day in 3600 years. The change was at once adopted in the greater portions of Italy, Spain, and Portugal. France and the Catholic parts of Switzerland, Germany, and the Low Countries soon followed; but the Protestants in the last-named countries

did not give in till 1700, when *eleven* days (from the intervening 1600) instead of *ten* required to be deducted. The Gregorian or *New Style* was adopted in England in 1752, and in Sweden in 1753; Russia, and those parts of Europe where the Greek Church prevails, still hold to the Julian or *Old Style*. In 1793 the National Convention of France promulgated the C. of the Republic, instituting a new epoch, but it was abolished by Napoleon, 1st January 1806.

Calendar, a technical term in the criminal law of England. At the end of the assizes, the clerk of the assize writes four lists of the prisoners, with separate columns, containing their crimes, with the verdicts given and sentences passed on them, leaving a blank column, in which, if the judge has reason to vary the course of law, he writes opposite the names of the capital convicts 'to be reprieved,' 'respited,' 'transported,' &c. Each of these lists is called a C. The four, being first carefully compared by the judge and by the clerk of the assize, are signed by them, and one is given to the sheriff, and one to the jailor; the judge and the clerk of assize each keeping one. The C. forms the only warrant of the sheriff for execution; and if he receives no subsequent order from the judge, he carries out the sentence of the law, as directed by it. Forms regarding the C. are not quite the same in all counties. In Lancashire, one is not given to the jailor, and one is sent to the Home Secretary.

Cal'endering, an important operation in the finishing of cotton, linen, and other woven fabrics. The word literally means cylindering, and the operation consists in passing the cloth to be operated on through between a series of strong cylinders or 'bowls' powerfully pressed against each other by screws and levers. Calenders are generally made with three or five bowls; the bowls in the one case being two of solidified paper, not wood, or cotton, with an intermediate smaller one of polished metal, and in the other three bowls are of paper or cotton, and two of metal. Bowls used formerly to be made of wood, but their tendency to crack or twist from exposure to the heat of the iron cylinder led to their disuse in C. establishments. They are still in use, however, at bleachfields and printworks. In a five-bowl calender the cloth is twice pressed for one pressure it receives in the three-bowl machine. The object of C. is to flatten, smooth, and give a uniform surface to the cloth operated upon. For certain finishes the calender is specially adjusted and regulated. Embossing is not an operation of the calender, but of a distinct machine employed in a C. establishment. Glazing of furniture chintz is effected by introducing a rubbing motion or 'friction' as it is called, caused by the revolving of the bowls at unequal speed. In such cases the metal cylinders, which are made hollow, are brought to a high degree of heat, by admission of hot iron bolts, or steam, or gas. But C., generally speaking, embraces all the varied operations of finishing, clothlapping, pressing, and packing, the 'calender' giving the general name to the whole concern.

Cal'ends. Each month in the Roman calendar was divided into three periods by the C., Nones, and Ides. The C., so called because on the appearance of the new moon the priests summoned (*calare*) the people together to tell them the arrangement of the sacred and other days of the month, fell on the first; the Nones, from *nonus*, marked the *ninth* day, inclusive, before the Ides, and fell in March, May, July, and October on the seventh, the Ides being on the fifteenth; in the remaining months on the fifth, the Ides being on the thirteenth. The Ides got the name either from an Etruscan verb *idware*, to divide, because they halved the month, or from the Greek *idos*, the full moon being then visible. The Romans did not number the days forward as we do, but backward from the next division, reckoning inclusively—i.e., both extremes; thus the 31st of January was *Præid Calendas Februarias*, the 30th *ante diem tertium Cal. Feb.*, and so on; and similarly with the other divisions. When an event occurred on the day of division, it was said to happen *Calendis*, *Nonis*, or *Idibus*, as the case might be. Rent, interest, bills, &c., were payable on the C.

Calendula, a genus of plants belonging to the natural order *Compositæ*. It gets its name from the fact that the species may be in flower on the *calends* of every month. They are natives of the Mediterranean region. One (*C. officinalis*, or pot marigold) has been long cultivated, and was at one time famous as a diuretic remedy.

Calhoun', John Caldwell, an American statesman, born at Abbeville, in S. Carolina, 18th March 1782, of Irish parents. In the war declared in 1810 between the States and Great Britain, he found the opportunity for a political career. He supported Madison and the war party, and entered successively the Congress and the Committee on Foreign Affairs. The National Bank (Union), the Tariff of 1816, and the reorganisation of the War Department under Monroe's presidency, were some of C.'s achievements. He was Vice-President under Adams and Jackson, but in 1829 he almost provoked civil war in Carolina, Virginia, &c., by publicly declaring that these states were entitled to annul the new tariff of 1828, which he considered arbitrary and unjust. This principle of 'State-rights,' the Constitution being a mere treaty, he afterwards defended in the Senate; later he went the length of advocating the repeal of the Union, slavery being, in his view, an integral part of the social system in the S. This he insisted on still more after the Mexican war. C. died at Washington, 31st March 1850, leaving a work on the philosophy of government. His collected writings and speeches occupy 6 vols. (Cralle's ed.).

Calibre (Fr. *calibre*, introduced in the 16th c. from the Ital. *calibro*, and that from the Arab. *kālīb*, 'form or mould'), a technical name for the bore of a firearm. The C. of ordnance has been greatly increased of late years—that of the 35-ton gun is 12 inches, while the 81-ton gun measures 15 inches; on the other hand, European armies are generally equipped with small-bore rifles, in which the bore is less than half an inch. Figuratively, C. means the compass of mental or intellectual qualities.

Calico Printing, the art of printing coloured patterns on a kind of cotton cloth known as calico, from Calicut, a town in Hindostan, at one time celebrated for its cotton manufactures, and from which cotton goods were originally imported into this country. The process employed in C. P. is, with some modifications, available for printing several other kinds of textile fabrics, such as linen, silk, and mousselin-de-laine; but none of these fabrics are extensively manufactured into printed goods. The art of C. P. was practised by slow and laborious processes from very remote times in India, Egypt, and China, and the printed chintzes of the E. were among the early imports of the E. India Company. Towards the close of the 17th c. the art was introduced into Europe, but the importation of the process into England was strenuously resisted by the silk and woollen weavers, whose hostility culminated, in 1720, in their obtaining by legal enactment a prohibition from weaving all printed cottons whatever, either of foreign or domestic manufacture. It was not till 1774 that the Act was repealed, by which time the printing of mixed fabrics had been firmly established in Lancashire. In the year 1738 C. P. was commenced in the neighbourhood of Glasgow, and these two localities are now the chief centres of this industry in Great Britain.

The printing process was originally accomplished by means of hand-blocks made of wood, on which patterns or portions of patterns for each different colour were cut, and for some styles of work block-printing is still employed. The blocks were made of well-seasoned, hard wood, with a printing surface not exceeding one foot square, and the application of the block to the surface to be printed was guided by pin-points along the edges of each block. As a different block was required for each separate colour or mordant on the pattern, the printer had often to go over each piece with seven or eight different blocks, so that the number of individual operations in printing 25 yards of calico would amount to many hundreds of layings. For each printer an attendant or 'teerer' was required—a boy whose duty was to spread evenly the colour on a prepared smooth cloth surface, on to which the printer dipped his block. After carefully fitting the block so charged with colour into the guide-points made by the pins on the edge of the block, the workman struck it with the shaft-end of a small but weighty hammer, which transferred the impression to the cloth.

Under the name of a Perrotine, a complex block-printing machine was invented by M. Perrot, which is still used to a limited extent on the Continent. The machinery now almost universally used for the printing of calico, &c., consists of various modifications of the cylinder printing machine, in which a number of separate copper printing cylinders, called rollers, are mounted, corresponding to the number of colours to be printed. The patterns on the copper cylinders are prepared in some cases by

punching with a die directly on to the roller, or by engraving on a small steel cylinder and transferring the impression to another called a mill, from which it is impressed by a revolving motion under heavy pressure to the prepared copper surface. Patterns are also etched on the rollers with nitric acid, by lines cut into a specially prepared varnish, by means of Rigby's pentagraph machine.

An immense variety of styles of C. P. are pursued in practice, which it would be altogether unnecessary to enumerate here in detail. The number of materials used for thickening the mordants of colours, and of combinations of colours, is also far too varied to be separately enumerated. Briefly, it may be stated that the greater proportion of the styles fall under one or other of the following heads—1st, dye-colours; 2d, steam-colours. Dyed goods are the most ancient style of printing, having, according to Pliny, been practised by the ancient Egyptians. This style is chiefly produced with madder and its derivatives, garancine and alizarine, but also with many dye-woods. Alizarine has now been artificially prepared from anthracene, one of the many products of coal-tar; and it, as well as madder extract, is much used as a steam-colour. In the printing of a dye-colour, the pattern is printed on by a mordant, to which the dye is subsequently fixed by dyeing. The principal mordants used are acetate of alumina, or red liquor, giving a red or pink colour with madder; and iron liquor, or acetate of iron, which yields purple and black, according to the strength at which it is used. A mixture of these mordants gives various shades of chocolate, and there are several other mordants in use for giving different colours. These mordants are prepared with gum or some other thickening, and printed in the machine, after which the mordant is fixed by what is called ageing, in a chamber or machine in which the cloth is exposed to heat and moisture. After ageing, the goods are passed through a solution to remove the thickening material of the mordants—a process formerly accomplished by washing in a mixture of hot water and cows' dung, but now by means of arsenite or silicate of soda. The goods are now ready for dyeing, which is accomplished by passing the pieces for such time as may be necessary through a dye-beck, in which the dye-liquor is kept at the temperature required. After dyeing, the pieces are washed and cleansed by passing through soap solution of the requisite strength and heat, and then washed again, and squeezed to expel the greater portion of the water, and then dried. To improve the white ground, the goods are passed through a weak solution of chlorine, and then driven over steam cylinders; after which they may be starched in a starching-mangle, calendered, folded, pressed, and packed ready for the market. In the printing of steam-colours, the colouring material is applied to the cloth direct by the printing cylinder, and subsequently fixed by steaming, which causes the colouring material, by the preparation employed, to enter the fibres of the cloth and become more or less insoluble there, according to the nature of the colour used. Steam-colours have now become a very important branch of C. P., and are indeed in process of superseding most of the other styles, the brilliant coal-tar colours so extensively used being almost entirely fixed by steaming. The bodies used for fixing steam-colours are tin mordants, tannic acid, arsenite of alumina, and other mordants, which are mixed with the dye-colours and printed together. Albumen, lactarine, &c., are used for ultramarine and other pigment colours generally, the fixing in this case being due to the coagulation of these bodies on the fibre caused by the steam heat. Arsenite of alumina is chiefly used for the fixing of aniline colours. Spirit-colours are printed by a modification of the steam-colour process, but with strong solutions of acid mordant and salts mixed with the dyeing decoction. They form brilliant but fugitive colours. The effects of C. P. are varied by numerous other operations, such as printing with resist pastes, which prevent the dye-colours from impregnating the portions over which they are printed, and by discharging colour by means of acid and a chlorine solution, as practised in printing on Turkey-red grounds. See BANDANA.

The most important discovery of late years in the process of C. P. is that of printing madder and alizarine colours directly on to the cloth, which may be said to have revolutionised the trade; and this process is becoming every day of greater importance, and what a few years ago was considered an impossibility is now an accomplished fact.

Callic'ula, a name applied to several bracts in union at the basis of the calyx, the divisions of the C. being the same number

as the divisions of the calyx, and alternating with them. It is seen in *Potentilla*, *Geum*, Strawberry (*Fragaria*, particularly in *F. indica*), and allied genera, as well as in most *Malvaceæ*, *Dianthus*, &c.

Calicut, a town and seaport in the province of Madras, district of Malabar, 3 miles N. of Beypur, the present terminus of the Madras Railway. It lies near the mouth of a river of the same name, has few good buildings, and its harbour is now nearly filled up with sand, but there are still some exports of betel, teak, sandal-wood, wax, and pepper. C. gave its name to *calico*, which was first brought hence to Europe, Pop. 20,000. C., which is an ancient town, was visited in the 7th c. by a fanatical band of Moslems (*Moplas*) from Arabia, who settled here, and soon became the chief merchants and traders. It was the first Indian town at which Vasco de Gama touched, May 18, 1498, and it was then a great trading place, and the flourishing residence of the powerful prince Zamorin or Tamuri. It was captured and pillaged by Hyder Ali in 1773, and became British in 1792.

Cal'if (Arab. 'successor'). On the death of Mohammed in 632, there were four candidates for supreme temporal and spiritual power among his followers, now masters of Arabia—(1) Abu Bekr (or Father of the Virgin), father of Ayesha, the favourite wife of Mohammed, and who had accompanied him in his flight from Mecca, and was saved with him in the cave; (2) Omar, the father of Hafsa, another of Mohammed's wives, to whom had been entrusted the *Caaba*, or coffer containing the sacred revelations of the Koran; (3) Othman, who had married successively two of Mohammed's daughters; and (4) Ali, the husband of Fatima, the only surviving daughter of Mohammed, who was besides Ali's cousin-german. After a dispute between the Ausarians, or keepers of Medina (Mohammed's residence), and the Mohadjerins or refugees of Mecca (Mohammed's birthplace), as to which city should nominate Mohammed's successor, and a proposal that there should be two independent successors, Abu Bekr was chosen C. (or successor) at a meeting of principal men, and the principle was laid down that the supreme power was elective, and that every one assuming sovereignty without the public voice should suffer death. Abu expressly disclaimed the title of C. of God and his Shadow upon Earth, which was assumed by his successors. He accepted a small salary for himself, and the surplus funds accruing to his treasury were every Friday dispensed to the meritorious and the poor. Many Arabian tribes refused to pay the *Zacat*, or religious contribution of tithe, alms, and tribute. Abu nominated Omar as his successor, and this was confirmed by election. Omar received the title of Emir al-Mumenin, or Commander of the Faithful, which, altered into Miramolin, was subsequently borne by all independent Moslem sovereigns. In this reign the great battle of Yermouh, which decided the fate of Syria, was fought (A.D. 636, 15th year of the Hegira); Manuel, the general of the Emperor Heraclius, was completely routed. This was followed by the invasion of Egypt, where Mokawhas, the leader of the Jacobite Copti, surrendered Memphis, probably from jealousy of the Greek Christians; Alexandria was taken, and its library destroyed. In the meantime the city of Bassorah had been founded on the united Euphrates and Tigris, and the battle of Kadesia (in which Yezdegerd, the last king of the Sassanids, was defeated) led the way to the conquest of Assyria, Persia, and, early in the following century, Transoxiana. Omar's age has been called the heroic age of Saracen history. He established the exchequer, which was now filled by the taxes of the newly-conquered district. After his death, the Council of Six Companions, whom he had appointed, chose as C. Othman, who promised to rule according to the Koran, the traditions of Mohammed, and the regulations made by the first two Califs (called the Seniors). The victories of Abdullah in Egypt, the 'gathering' of the Koran, and the conspiracy of Ibu Caba, mark this reign, in which, perhaps, the first vizier also appeared, taking charge of the C.'s correspondence, and characteristically joining in the cabal against him. The next C., Ali (the Lion of God), the first who bore the religious title of Imam, lost much of the temporal power. The party of Motazeli, or Separatists, joined with the insurgent Moawiyah, the head of the family Ommiah, and Governor of Syria, and, after a mock arbitration, Syria became independent, and Egypt was lost. Ali's descendants were entitled to wear a

peculiar turban, and to the name of Sheriffs, Fatimites, and Emirs. The Ommiad dynasty of Califs (ruling at Damascus from 661 to 752) extended the Saracen empire in Africa from the Nile to the Atlantic. (See OMMIADS.) Constantinople was besieged, Galatia occupied, and Carthage taken. The Moors, or *Barbers*, adopted Mohammedanism, and, after two descents on Spain (710-711), the Gothic monarchy was destroyed, and Musa, in spite of the noble defence of the *Emeritans* (the inhabitants of Merida, supposed to be descended from discharged Roman legionaries) and others, drove the Goths into the Septimania, the modern Languedoc. In 750 Al Heman (the As of Mesopotamia), the last of the Ommiads, was driven from Damascus by Abu Moslem, and the Abbasside dynasty, in the person of Abul Abbas, was founded. It removed the permanent capital to Bagdad, where it continued, as the supreme spiritual power, after it had lost all political importance, till the year 1258, when it was crushed by the Tartars. (See ABBASIDES.) In 1517 Selim I., the Turkish Sultan who conquered Egypt, assumed the title of C. In Spain, the Ommiad Caliphate was terminated in 1031, and the Moorish power gradually dwindled until the expulsion of the Moors in 1492.

California, one of the United States of N. America, is situated on the Pacific coast, and extends from 32° 45' to 42° N. lat., having an area of 188,981 sq. miles. A conspicuous feature of the region is the mountain range of the Sierra Nevada, which runs through the whole length of the state. Its highest peaks rise to a height of about 14,000 feet. A lower range runs along the shore, and between these two ranges lie the Sacramento and other valleys, containing the most fertile part of the state. The Sierra Nevada range exerts a great climatic influence upon the Pacific slope. The warm winds, laden with vapour from the ocean, here break upon this wall, and shed their riches upon the mountain sides and valleys. The climate of C. may be ranked as the highest or best in the United States; in many places it is a perpetual spring, and the land is covered with a vegetation of the greatest luxuriance. There are two seasons, the rainy and the dry. Agriculture was at first neglected, but it is now advancing rapidly, and, indeed, C. occupies a prominent place in the Union in this respect. The best wheat in the United States is raised here; the annual product in 1872 being 29,000,000 bushels, and it commands the highest price in the markets of Europe. In 1875 nine counties of C. had 19,798,290 grape vines, and it was estimated that 8,000,000 gallons of wine were made in the state.

C. was discovered by Cabrillo, a Spaniard, in 1542. It was colonised by the Spaniards last century, but in 1802, according to Humboldt, there were only 16,862 inhabitants, mostly converted Indians. The country fell into disorder under the successive anarchies of Mexico, and, after the war between that nation and the United States, it was ceded February 2, 1848, and admitted as a state, September 9, 1850. In May 1848, gold was discovered, and so enormously rich were the deposits, that not only was the country revolutionised, but the conditions of trade and commerce in the world were permanently affected by the discovery. The yield in Californian gold in 1869 amounted to \$21,472,851, and from 1848 to the present time it may be set down as about \$1,000,000,000. The yield of gold and silver in 1874 was \$20,300,531, and in 1875 \$17,753,151. The state also possesses mines of silver, copper, quicksilver, iron, platinum, and coal.

Since the opening of the Pacific Railway, C. has been much resorted to by tourists, attracted by the fame of its scenery. The Yosemite Valley, now a national pleasure park, possesses scenery of unique and wonderful character, with a waterfall of 2550 feet. The Pohono, or Bridal Veil, has a fall of 1000 feet. In Mariposa County there are also the largest trees in the world—the *sequoia gigantes*, one of them, 274 feet high, and the trunk 40 feet in diameter at the base. It is supposed to be 2000 years old.

The life of the country centres around the noble Bay of San Francisco, which is approached from the sea by the 'Golden Gate,' about a mile in width. The bay expands inward about 60 by 50 miles, affording space for the commerce of the world. The annual value of farming produce, according to the census of 1870, was \$49,856,024; the total value of all industries was \$182,000,000; the actual value of all property, real and personal, was \$638,767,017; the state debt was \$18,089,082. In

1872 there were 1013 miles of railway, and many thousand miles of artificial watercourses for mining purposes. C. has maintained a sound gold currency throughout. The principal towns are San Francisco, Sacramento City (the capital), and Stockton; and the chief river is the Sacramento, with its tributary the San Joaquin. There are several Catholic and Protestant colleges in C.; and general education is making progress. Pop. (1870) 560,247, including 49,310 Chinese, and in 1875 estimated at over 800,000, including 75,000 Chinese.

California, Gulf of, a deep inlet of the Pacific, lies between the peninsula of the same name and the Mexican mainland. It is 700 miles long, and from 40 to 100 broad, and receives at its head the Gila and Colorado. The gulf was first visited by Hernando Cortés in 1534, and received the name of Sea of Cortés.

California, Mexican, is the long peninsula projecting from the state of C., and separated from the mainland by the Gulf of C. It has an area of 61,545 sq. miles, and a pop. of 23,195. It is mostly desert, and is traversed by a mountain range, which occasionally rises to a height of some 5000 feet. Capital, La Paz (pop. 509). C. does not form a state of Mexico, but is simply a territory.

Calig'ula, Caius Cæsar Augustus Germanicus, the third of the Roman emperors, youngest son of Germanicus, was born at Antium, 31st August, A.D. 12. As emperor, his contemporaries called him Caius; the name Caligula, given to him while a boy by his father's soldiers in Germany, from his wearing the *caligæ*, or half-boots of the common soldiers, he took as an insult. After filling the offices of quæstor, pontiff, and augur, he was by the senate and people accepted (37 A.D.) as sole successor to Tiberius. For a few months he governed with admirable moderation and magnanimity, but a serious illness, the consequence of a life of unbridled licentiousness, destroyed his powers of dissimulation and self-control, and his subsequent life was a continued series of atrocities. He ordered his nearest friends to be put to death, or to make away with themselves; spectators in the circus were taken at random and thrown before the wild beasts; to give zest to his meals persons were tortured to death before his eyes; and he even expressed the wish that the whole Roman people had only one head that he might make an end of them by a single blow. C.'s lust was insatiable, and he committed incest with his own sister. He built a bridge of boats between Baizæ and Puteoli, across which, in imitation of Xerxes, he rode in triumph. He gave a magnificent banquet on the middle of the bridge, and by way of amusement caused numbers of the spectators to be thrown into the sea. He ordered divine honours to be paid to himself as to a god, and he raised his horse Incitatus to the consulship. After some years of prodigal expenditure, his mania assumed the form of avarice, and he extorted money by every expedient. He even instituted a brothel in his palace, and sent out his slaves to induce the public to patronise it. After the discovery of several schemes of assassination, he was at last put to death by Chærea, tribune of a prætorian cohort, 24th January, A.D. 41.

Calit'ri, a town of Italy, province of Avellino, on the left bank of the Ofanto, 32 miles E. of the city of Avellino, in a pastoral country. Pop. between 5000 and 6000.

Cal'iver, a kind of hand-gun, was of a size between the arquebuss and the musket.

Calix'tines (Lat. *calix*, 'a cup'), the larger of the two parties into which the Hussites (q. v.) were divided in the civil war of the 15th c. Their deputies at the Council of Basle (1433) demanded that the Eucharist should be administered in both kinds (*sub utraque specie*, from which words they also got the name of Ultraquists, as C. from demanding *the cup*). Their demands being partially granted, a compromise was agreed to with the Romish party, which consequently absorbed many of the sect, while the rest joined the Taborites (q. v.).

Calix'tus, the name of three popes and of one anti-pope.—**O. I., St O.**, or **Oallistus**, is said to have been born a slave at Rome about the middle of the 2d c. He was elected Bishop of Rome in the year 217, and held that office till the year 222, when he died a martyr. The character of C. has been the subject of keen discussion during recent years, on account of the abuse heaped on him in a Greek MS. found at Mount Athos in 1842, published in 1851 at the expense of the University of

Oxford, under the title *Philosophumena*, and ascribed by Bunsen to Hippolytus. C. was a zealous opponent of the doctrine of the Trinity, and took mild views of Church discipline, allowing priests to marry after ordination.—**O. II.**, Guido, Count of Burgundy, pope from 1119 to 1124, was, before his elevation, Archbishop of Vienne, and papal legate in France. In the year 1122 he concluded a treaty with the Emperor Heinrich V., by which he succeeded in reserving for the pope the right of Investiture (q. v.), and in 1123, the year before he died, held the first Œcumenical Council of the Lateran. C. acted as mediator in the dispute between Henry I. of England and Louis VI. of France regarding Normandy, paid the ransom for which Baldwin II., King of Jerusalem, was delivered from the Turks, repressed the tyrannous excesses of the petty Italian princes, and added to the adornments of the principal churches at Rome.—**O.**, the **Anti-pope**, Giovanni Unghieri, Cardinal-Bishop of Tusculum, was set up in 1168 by the Emperor Friedrich I. as a rival to his enemy, Pope Alexander III. Abandoned by the Emperor and his partisans after the peace of Venice in 1177, C. submitted to Alexander, who pardoned him, and appointed him governor of Benevento.—**O. III.**, Alfonso Borgia, a Spaniard, Bishop of Valencia, was elevated to the papal dignity in 1455. Before this event he had been long a trusted councillor of Alfonso, King of Aragon and the Two Sicilies, and had negotiated a peace between Castile and Pope Eugenius IV. A skilful diplomatist and subtle lawyer, he yet failed signally as a pope. Great efforts put forth by him to organise a grand crusade against the Turks ended in the capture of three useless islands. The open favour he showed his nephew, Rodrigo Lenzuoli, afterwards Pope Alexander VI. (see **Alexander VI.** and **Borgia**), lost him the esteem of King Alfonso, and aroused the hostility of his Roman subjects. The *Office of the Transfiguration* in the Roman Catholic service is ascribed to him. C. died August 6, 1458.

Calix'tus, Georg, a German theologian, formerly of great mark, was born at Medelby, in Slesvig, 14th December 1586. He was the originator of the Syncretistic movement (see **SYNCRETISM**) which followed the Reformation on the Continent. Indocinated by his father, who had been a pupil of Melancthon's and imbibed his tolerant spirit, with the idea that all Christians might find common ground on which they could agree, C. was confirmed in his conviction by an extensive knowledge of the world and acquaintance with men of different creeds, gained in travelling. On his return to Helsingborg, where he had studied, he was elected (1613) to the chair of Theology, which he filled for forty-two years, till his death, 19th March 1655. During this time C. devoted all his powers to work out the idea of his life, seeking especially to reconcile the Lutherans and Calvinists. The last twenty years of his life were spent in controversy with the High Lutherans and the Jesuits, being regarded by the former as a renegade, and by the latter as an atheist. Among C.'s writings may be mentioned the *De Præcipuis Religionis Christianæ Capitibus* (Helmst. 1613); *Epitome Theologiæ Moralit* (Helmst. 1634); and *De Tolerantia Reformatorum* (Helmst. 1658). See Gass, *Georg C. und der Synkretismus* (Bresl. 1846); Henke, *Georg C. und seine Zeit* (2 vols. Halle, 1853-56). Henke also published his *Briefwechsel* (Halle, 1833). C.'s son, **Friedrich Ulrich** (died 1701), was also a Professor of Theology, published some of his father's writings, and defended the Syncretistic theology.

Call, the whistle used by the boatswain and his mates. Its use corresponds to that of the military drum and bugle, conveying special orders for hoisting, lowering, heaving, &c.

Call, 1. according to the Scriptural or theological usage of the term, is the act of the Holy Spirit, or the divine influence by which men are brought into saving union with Christ, and translated from the kingdom of darkness into the kingdom of God. 2. There is a distinction made, however, between this effectual C. and the external C. in the Word of God, which is addressed to all. The latter includes (1) a declaration of the plan of salvation; (2) the promise of God to save all who accede to the terms of that plan; (3) command, exhortation, and invitation to all to accept of the offered mercy; (4) an exhibition of the reasons which should constrain men to repent and believe; all which are included in the gospel. 3. There is also a C. to office in the Church, which is marked by right motives in seeking it,

that is, by a desire not for the emoluments or advantages of the office, but to promote the glory of God and the salvation of men. See Hodge's *Systematic Theology* (1873).

Call of the House, a phrase applied to a measure taken to enforce the attendance of members upon their parliamentary services on urgent occasions. In the House of Lords, when, with a view to compulsory attendance, an order has been passed that the list of names be called over, the Lord Chancellor has sometimes addressed letters to the peers requesting their presence, as on November 1, 1810, when George III. was seriously ill. The bill for the degrading of Queen Caroline occasioned, in 1820, the most urgent C. of this house in modern times. In the House of Commons it is usual to name a day for the C., which will give members time to come from all parts of the country—a week or ten days being customary. The order for a C. has always appended to it, 'that such members as shall not then attend be sent for in custody of the sergeant-at-arms.' On the day appointed, the order, when read, may be proceeded with, postponed, or discharged, just as the house resolves. The names are called from the Return Book, according to counties, the names of which are arranged alphabetically—England and Wales first, then Scotland and Ireland. Formerly, fines and other punishments were inflicted for non-attendance; but latterly absentees have been dealt very leniently with, committal to the custody of the sergeant-at-arms, and the expenses incident to this commitment, being the heaviest penalty. Calls have fallen into disfavour: they can only compel a member to be present, not to vote. The last C. in the House of Commons was in 1836, when a motion on the pension-list was brought forward. See *A Treatise on the Law, Privileges, Proceedings, and Usage of Parliament*, by Sir T. Erskine May (7th ed. Lond. 1873).

Call to the Bar is the phrase employed in England and Ireland to denote the public reception of a student of law into the rank or degree of Barrister (q. v.). In Scotland the same process is termed *Passing Advocate*. See ADVOCATE.

Call'a, a genus of plants of the natural order *Orontiaceæ*, chiefly herbaceous marsh plants, natives of Northern Europe and N. America, and possessing acrid caustic properties. The rhizomes of *C. palustris* contain much starch, which can be obtained in an edible state by heating the ground-root stocks until their acrid qualities are dissipated. The meal thus obtained is nourishing, and in great popularity with the Laplanders, under the name of *Missebroed*—probably the Norwegian name for *C. Richardia Ethiopica* (the so-called 'Ethiopian lily') was long included under this genus, and is still so named by horticulturists. It is a native of Europe, Siberia, and N. America.

Call'ander, a village on the Teith, in Perthshire, 15 miles N.W. of Stirling, and a station on a branch of the Scottish Central Railway. From its vicinity to the Trosachs, and the other romantic scenery of *The Lady of the Lake*, it is much resorted to by tourists. Close by is the famous Pass of Leny. The new Callander and Oban Railway, though not complete, conveys passengers through Glen Ogle and along the banks of Loch Tay as far as Tyndrum. Pop. (1871) 1271.

Calla'o, a fortified seaport of Peru, and the great S. American station for war-ships, at the mouth of a river of the same name, 6 miles W. of Lima by railway. It has a splendid harbour and roadstead, sheltered by San Lorenzo island, and does an active export trade, chiefly in cotton, copper, bark, and hides. The only building of importance is the custom-house with its immense magazines. In 1746 C. was entirely destroyed by earthquake, and it has since suffered considerably from the same cause. Pop. about 20,000.—C. is also the name of a small island in the Chinese Sea, 16 miles from the mouth of the river Fai-Fo, with an area of 10 sq. miles.

Callian'dra, a genus of Leguminous plants, natives of America, from Buenos Ayres to California. Many are in cultivation, and in all about eighty species are known, all more or less ornamental. The Peruvian women deck their hair with the flowers of *C. trinerve* (the 'Seda sisa' or silk-flower).

Callia'no, a town of Austria, in the Tyrol, on the Adige, 10 miles S. of Trient, in the strongly fortified pass of Castel della Pietra, notable for the defeat of the Venetians by the Archduke Sigismund in 1487, and the storming of the place by Napoleon, September 4, 1796.

Callich'thys, a genus of Teleostean fishes belonging to the family *Siluridae*, or 'sheat fishes,' which is represented by the more familiar *Silurus glanis* of European rivers. The body in C. is covered by rows of bony scales, which are of large size on the head. The mouth is of small size, and provided with minute teeth. These fishes, which inhabit S. American rivers, appear, like the *Anabas* (q. v.) or climbing perch of India, to leave the water, especially during the dry season, and to make their way over the land to other pools. Like the mud-fishes, they sometimes bury themselves in the mud of marshes and wet pastures. These fishes are also said to construct a kind of nest, in which the eggs are deposited, and watched by both the male and female during their development. In *Doras*, allied to C. in structure and habits, the side-plates are broad and spinous.

Callig'onum, a genus of shrubs belonging to the natural order *Polygonaceæ*, found in the Eastern Mediterranean region and in Central Asia. The acid fruits and shoots of *C. Pallasia* of the steppes near the Caspian Sea and the lower part of the Volga, are often eaten by the Kalmucks and other nomads to allay thirst. These tribes also obtain a nutritious gum like tragacanth by pounding and boiling the root.

Callim'achus, a distinguished poet and grammarian of Cyrene in Africa, son of Battus and pupil of Hermocrates, taught rhetoric and belles-lettres at Alexandria. Among his pupils were Aristophanes the grammarian and Apollonius of Rhodes. C. was a favourite of Ptolemy Philadelphus and his son, and held the office of librarian of the Museum, B.C. 260-240. Of his voluminous writings only a few poems, epigrams, and fragments remain. Catullus translated his poem on *Berenice's Hair*, and Propertius adopted him as his model. The style of C. is laboured and artificial. The best editions of C. are those of Ernesti (1761), Lœsner (1774), Volzer (1817), and Blomfield (1815).

Call'inger, a celebrated fortress of India, in Bundelcund, 112 miles S.W. of Allahabad, on a hill-top 700 feet above the surrounding plains. A decayed town of the same name lies at the S.E. base of the hill, and in the vicinity are the famous rock-cut temples of Siva. The British stormed C. in 1812.

Calling of the Diet is the Scotch law term for Arraignment (q. v.). Fifteen days before trial, a copy of the Indictment (q. v.), with a list of witnesses to be examined in support of it, and a list of the jury assize, must be served on the prisoner. On being placed at the bar, he is therefore presumed to know the charge made against him. If he or his counsel, however, desire it, the indictment is read aloud in open court. The prisoner must then state his objection, if he has any, to the relevancy. Should he do so, the court must consider the objection, which, if sustained, is fatal to the indictment; the prisoner being sent back to jail to await a new indictment, unless the prosecutor abandons the action, in which case the prisoner is discharged. Should the objection to relevancy fail, the prisoner must plead 'guilty' or 'not guilty' to the charge.

Callio'pe ('the beautiful-voiced'), in Greek mythology the Muse of epic poetry, and the mother of Orpheus, Hymen, &c. In works of art she appears seated and holding a writing tablet and stylus. As the chief of the Muses she is sometimes made their representative.

Callipers, an instrument like a pair of compasses with curved legs, used for measuring the diameter of bodies.

Calliste'mon, a genus of plants of the natural order *Myrtaceæ*, handsome flowering trees and shrubs of Australia. Many of them are cultivated in this country.

Callis'thenes, of Olynthus, born about 360 B.C., was the son of Hero, a cousin of Aristotle, by whom he was educated at Stageira. A fellow-pupil of Alexander the Great, he accompanied that monarch on his expedition to India, B.C. 334. C.'s bluntness of speech, and his uncourtier-like rebuke of Alexander for presuming to claim divine honours, led to his imprisonment and death, B.C. 328. His historical writings have been lost, but the depreciatory criticism of Polybius, Cicero, and Strabo, would seem to make this a matter little to be regretted. Several MSS. in the Paris Library, professing to be the work of C., are spurious.

Call'ithrix. See SQUIRREL MONKEY.

Call'itria. See SANDARACH.

Call'ot, Jacques, a French artist, engraver, and designer of great merit, was born in 1592, at Nancy, where (after several visits to Italy) he settled and died in 1635. His numerous engravings, of which 1800 are preserved at Dresden, are invaluable representations of the life and manners of the 17th c. Perhaps the most famous of his productions are 'La Siège de Breda' (6 plates), 'Les Misères de la Guerre' (18 plates), 'Les Deux Tentations de Saint Antoine,' and 'La Grande et la Petite Passion.' See Maume, *Recherches sur la Vie et les Ouvrages de J. C.*; Green, *Description of the Works of C.* (Lond 1814); and De Haldat, *Notice sur C., considéré comme Peintre*, in the *Mémoires de l'Académie de Nancy* (1839).

Cal'met, Dom Augustine, a learned biblical writer, was born near Commerci, in Lorraine, 26th February 1672. In 1689 he became a monk of the order of St Benedict. Having mastered the Hebrew and Greek languages, he soon gained such an acquaintance with the Scriptures that he was appointed to teach the youthful alumni, first in the Abbey of Moyen-Moutier, and then in that of Munster. The notes prepared for this purpose formed the basis of his *Commentaires sur tous les Livres de l'Ancien et du Nouveau Testament*, after the publication of which promotion rained upon him, and he died Abbé of Senones, 20th October 1757. C. was a voluminous writer, but his intellect was not equal to his industry; and his *Dictionnaire Historique et Critique de la Bible*, his *Histoire Universelle*, &c., have no real place in critical or historical literature. See Fange's *Vie de Dom C.* (1763), and C.'s *Autobiographie* in the Lorraine Library.

Calms, the name given to those regions intermediate between the latitudes of trade-winds and variable winds, where lengthened periods of perfect calm occur. They are dreaded by sailing vessels even more than storms.

Cal'mucks. See KALMUCKS.

Calne, a market-town of Wiltshire, on the Marden, and the terminus of a branch line of the Great Western Railway, 31 miles N.N.W. of Salisbury. It has a massive church, with a fine square tower, a town-hall, and an extensive flax-factory. There is also a considerable corn trade. Pop. (1871) 5315. C., along with part of Blackland and Calstone, returns one member to Parliament. Some Roman remains have been discovered at C., and here the kings of the West Saxons had a residence, but no trace of the dwelling exists.

Caloo'za, or **Kalocsa**, a town of Hungary, on the Danube, 69 miles S. of Pesth, in a region of marsh and malaria. It has a cathedral, and in the palace of the archbishop is a library of 30,000 volumes. Pop. (1869) 16,302. Near it is Hajos (pop. 3829), with the archbishop's summer palace.

Calomarde or **Calomarda**, **Don Francisco Tadeo**, Count, a Spanish politician, was born at Villel, Aragon, in 1775, studied at Saragossa, and passed as an advocate. After the return of Ferdinand VII., he was appointed to the highest office in the *Secretaría General de Indias*, but lost it for accepting a bribe. He turned to the Liberals, who would not have his support, then became reactionary again, and in 1823 was appointed Secretary of the *Cámara del Real Patronato*, and, shortly after, Minister of Justice. In this office he persecuted the Liberals, favoured the party of Don Carlos, recalled the Jesuits, shut the universities, and reopened the monasteries. C. had to flee from Spain in 1833 for advising the King to restore the Salic law, thus excluding Christina and securing the succession to Don Carlos. He died at Toulouse in 1842.

Cal'omel is a compound of mercury or quicksilver with chlorine, and is called by chemists subchloride of mercury or mercurous chloride. It has been used in medicine since the 7th c. It sometimes occurs as a mineral. It is prepared by several methods, the simplest of which consists in heating sulphate of mercury with metallic mercury and common salt in a large glass matrass. In this reaction C. is formed, and sublimes on the cool part of the glass vessel, whilst sulphate of soda remains.

The C. thus produced is powdered and repeatedly washed with water to remove *Corrosive Sublimate* (q. v.). C. is insoluble in water, but slightly soluble in acids. See MERCURY.

Calonne, **Charles Alexandre de**, born at Douai, 20th January 1734, began life at the local bar, and became Public Prosecutor and Master of Bequests to the local Parliament or court. After Turgot and Necker were dismissed, C., under the patronage of the Count of Artois, was appointed Controller-General in 1783, and immediately began to pay off debts and arrears, and to make large disbursements, especially to the court, the funds for which he obtained by reckless borrowing and additional taxation, and by anticipation of the revenue. Of most of his edicts the King had to compel the registration. With a deficit of 112 million francs, he called the famous Assembly of Notables of 1787, and submitted a plan involving the taxation of the landowners and clergy, and the abolition of feudal services and the salt tax. His inability to show a properly discharged account decided his fate, and he was exiled by the King to Lorraine. C. went to England, and, after an attempt to enter the States-General, attached himself to the Royalist party. His *Tableau de l'Europe en Novembre 1795* gave offence to his patrons, and in 1802 he obtained leave from Napoleon to return to France, where he died, 30th October 1802. His long published controversy with Necker is said not to clear him from suspicions of malversation.

Calophyll'um, a genus of plants belonging to the natural order *Cusciaceæ*, containing about twenty-five species, chiefly natives of the eastern hemisphere, four or five being found also in America. The seeds of *C. Calaba*, a native of Brazil and the W. Indies, yields an oil which, in the latter country, is used for lamps. From the seeds of *C. Inophyllum* of the E. Indies and the Malay Archipelago is obtained a thick, dark-green, highly-scented oil, used for lamps and medicinally. Its timber is also valuable for mats and shipbuilding purposes generally, and the resin which exudes from the stem is sold as one of the kinds of E. Indian Tacamahac. *C. Tacamahaca* of Bourbon and Madagascar, *C. Brasiliense* of Brazil, and other species, yield a similar resin. *C. angustifolium* (the piney-tree) of Penang furnishes good spars, called *peon*.

Caloric, the name given to Heat (q. v.) when the latter was supposed to be a substance.

Caloric-Engine, a name given, not very happily, to an engine in which heated air is used as a medium for transforming heat into work. Merely as a fluid, air does not possess any advantages (for this purpose) over steam, the point in its favour being that its temperature can be raised indefinitely without increasing its pressure, while in the case of steam, the temperature and pressure increase together, the latter rising much faster than the former. The temperature to which the air in an engine is raised may be anything less than that which will injure the materials of which the machine is composed, while steam, before it had even approached such a temperature, would have attained a pressure which we should at present consider dangerous, and on this account its temperature has to be kept down. The importance of this difference will be realised when it is remembered that in any heat-engine (such as a steam or air engine) the proportion of the whole heat supplied, which can be turned into

work is expressed by the equation $\frac{T_1 - T_2}{T_1}$, where T_1 is the higher and T_2 the lower of the limits of absolute temperature between which the engine works. In a condensing steam-engine, working with steam of 75 lbs. per sq. inch pressure above the atmosphere, the value of the above fraction, which is called the maximum theoretic efficiency of the engine, is about 0.24, while in an air-engine, working between 190° and 900° Fahr., it is 0.54. In other words, if the same amount of heat be supplied to both these engines, the latter will be theoretically able to transform more than twice as great a part of it into work as the former.

In practice, however, no such result has ever been obtained, for steam is, in many respects, so much more easy a fluid to handle than air, that the ratio between the actual and the theoretical efficiency has always been much greater with the former than with the latter fluid. Certain constructive difficulties also—which we have not space here to describe—have prevented its permanent success, even in those cases where the best results

have been obtained, as in the case of Mr Stirling's engine at Dundee.

In order that any heat-engine may attain its maximum theoretic efficiency, it is necessary that all the heat received by the fluid should be received while it is at its highest limit of temperature, and all the heat rejected be rejected at its lowest limit. This is not the case in ordinary steam-engines, but the heat received below the higher limit bears but a small proportion to the latent heat of the steam, which is all received at the higher limit, and the loss of efficiency from this cause is therefore comparatively small. It is otherwise where air is the fluid used, in which case the non-fulfilment of the required condition entirely destroys the efficiency of the engine. The economiser, or 'regenerator' (an invention of Dr Stirling's), is an apparatus which enables this condition to be attained by alternately storing up and restoring to the air as much heat as corresponds to the difference between its limits of temperature.

In some air-engines the gases from the furnace are used instead of air with favourable economic results. Where, however, such engines have no 'regenerator' they cannot possibly be economical, and possess no advantage except the absence of a boiler, and of consequent risk of explosion. In Stirling's engine the air was used at a considerable pressure, the working cylinder was kept cool, and an economiser was applied. In an engine of Mr Shaw's, which attracted attention at the Paris Exhibition, an economiser was also employed, but the furnace gases were used instead of air, the pressure being therefore low, and the engine bulky. These two are the principal types of C.-E., but neither of them will come into use without much modification. If a successful C.-E. is ever to be designed, it must probably unite the advantages of both.

Calorimeter, an instrument for measuring the specific heat of a body. The apparatus is constructed with a view to eliminate as far as possible the effects of radiation, and is described in most text-books on physics. The determination depends upon the principle of latent heat, and is obtained by measuring the quantity of ice at zero Centigrade, which is converted into water through the transference of heat from the substance under consideration, which substance is at a known temperature. See **HEAT**.

Calot'ropia. See **MUDAR**.

Calott'istes (Fr. *calotte*, 'a small cap,' especially one worn by monks over their tonsure), a French association of wits and satirists, formed during the reign of Louis XIV., who indulged in the pleasantry of sending to public men who had made themselves ridiculous a patent to wear the monk's cap, as a hint that their weak point was exposed. Finally venturing to attack royalty itself, the association was dissolved by the minister Fleury. See *Mémoires pour servir à l'Histoire de la Calotte* (Basel, 1725).

Calotype, or **Talbotype**, a photographic process published in 1839 by Mr Henry Fox Talbot. As practised by the inventor, the method consists, in the first place, in the preparation of *iodised paper* in the following manner:—Brush one side of a sheet of writing paper of good quality with a solution of nitrate of silver, 50 grains to 3 oz. of water, and when dry immerse the paper for a few minutes in a solution of potassium iodide, 1 oz. in 1 pint of water; remove excess of potassium iodide by soaking the paper in water, then dry it. These operations should be performed by candlelight. The paper thus coated with yellow iodide of silver is very slightly sensitive to light, and if protected from sunlight will remain unaltered for any length of time. The second stage of the process consists in rendering the iodised paper highly sensitive to light by washing the paper with *gallo-nitrate of silver*, made by mixing, in equal parts, a solution of nitrate of silver (50 grains to 1 oz. of water), to which one-sixth part of glacial acetic acid has been added, with a saturated aqueous solution of gallic acid; then washing the paper with water and drying with blotting-paper. Daylight should be excluded during these operations. The C.-paper is now ready for use, and so sensitive is it, that by exposure in the camera for less than a second to diffused daylight, a latent image is impressed upon it, which is developed by treatment with the gallo-nitrate of silver, then washing with water, and drying. The picture, which is a *negative* one—that is, the lights and shadows are reversed, can now be fixed by washing with a solution of bromide of potassium, 10 grains to 1 oz. of water, or

with hyposulphite of soda solution, 1 part to 4 of water, and afterwards with water. See **POSITIVE PRINTING** for the manner of obtaining positive prints from this negative. The original C. process just described has undergone several important modifications, but even the improved methods have fallen greatly into disuse.

Caloy'ers (a corruption of Gr. *kalos gerōn*, 'good old man'), are monks of the Greek Church, who belong to the order of St Basil (q. v.). They are divided into three classes—the *Archari*, or novices; the *Microchemi*, or ordinary monks; and the *Megalochemi*, who profess a higher standard of sanctity. Of their numerous monasteries, the most famous is that at Mount Sinai, founded by the Emperor Justinian. At Mount Athos they have twenty monasteries. There are also female C., or nuns, who, like the monks, follow the rule of St Basil.

Cal'pee, a town of British India, district of Jaloun, N.W. Province, on the Jumna, about 45 miles S.W. of Cawnpore. It has manufactures of cotton, paper, and sugar, the last of which is of extremely fine quality. Pop. (1872) 18,514.

Calpentin', a low peninsula running along the W. coast of Ceylon for a distance of 30 miles. It is transformed into an island during the prevalence of the N.E. monsoon.

Calpurnius, the *Gens Calpurnia*, an old Roman clan that claimed descent from Numa, but the Calpurnii were obscure till the time of the first Punic War.—**C. Calpurnius Piso** obtained the consulship in B.C. 180, and thereafter the Pisos were among the most illustrious families in the state.—**Lucius Calpurnius Bibulus** was Cæsar's colleague in the consulship, 59 B.C. His election was carried by means of the aristocratic party, that he might thwart Cæsar's agrarian law; but his efforts in this direction were unavailing. He was equally unsuccessful, while in command of Pompey's fleet in the Ionian Sea, in preventing Cæsar's crossing over into Greece. Lucius died 48 B.C. A celebrated lady of the clan was Calpurnia, the last wife of Julius Cæsar. In consequence of dreams of the previous night, she vainly endeavoured to dissuade her husband from leaving his house on the fatal Ides of March, B.C. 44. She was a quiet, home-loving, affectionate wife, who took no part in politics.

Calatabello'ta (Arab. 'the castle of the cork-trees'), a town of Sicily, province of Girgenti, on a river of the same name, about 8 miles N.E. of Sciacca. It is built round an old castle on a rock which overhangs the river near its source. One of its churches, the *Chiesa Matrice*, is much admired. Pop. about 6000. C. was taken by the Saracens in the year 840.

Caltanisset'ta, a fortified town of Sicily, capital of the province of the same name, on Monte Giuliano, about 28 miles N.E. of Girgenti, has a cathedral, numerous churches and convents, and salt and sulphur works. Pop. 16,563.

Cal'tha, a herbaceous marsh plant belonging to the natural order *Ranunculacea*. *C. palustris*, the marsh marigold, the May blobs, the *Populage* of the French, the *Sumpfdotter-Blume* of the Germans, is a common British plant, and is also found wild throughout almost the whole of Europe, Western Asia, and N. America. The flower buds are used as a substitute for capers. They have, however, no flavour of capers whatever, and are not free from acrid and poisonous qualities. The juice of the petals boiled with alum stains paper yellow. In N. America it is used as a potherb in spring when coming into flower. The C. of the Latin poets appears to be the common marigold. C. is the king-cup, water-golland, or yellow gowan of the Scottish peasant. The flower buds are 'the cuckoo buds of yellow hue' of Shakespeare.

Caluire', a fortified town in the department of the Rhone, France, on the left bank of the Saone, 3 miles N.N.E. of Lyon. It forms one of a series of forts in an *encinte*, partly encircling Lyon, and stretching between the Saone and Rhone. Pop. of C. and Cuire (1872), 6773.

Calum'ba, or **Colombo**, the root of *Fateorhina C.* and *F. Miersii*, plants of the natural order *Menispermaceæ* (q. v.), externally used in medicine. It is now chiefly obtained from Mozambique, though, as the name expresses, it was at one time exported from Colombo in Ceylon. It is collected wild in the

woods. The roots are sliced and dried in the shade, and in this state it is exported. It then appears as a dry, very bitter-tasted, faintly aromatic substance. It owes its bitterness and tonic qualities to the alkaloid Calumbine or Berberia. It is also demulcent and non-stimulant, and hence can be employed when the stomach will refuse every other tonic. It appears also to possess certain narcotic properties. Diarrhoea and dysentery are the diseases it is most employed in. *Cocculus Indicus* (q. v.) also belongs to the same order, and possesses similar properties. The roots of *Fraseri Walleri*—sometimes called American or false C. root—is sometimes substituted for it, but it possesses different properties. At one time C. was believed to be got from *Cocculus palmatus* (*Jateorhiza palmata*). See FRASERA.

Cal'umet, a tobacco-pipe, consisting of a bowl of carved red steatite or other stone, with a reed stem 3 or 4 feet long, beautifully ornamented with feathers, dyed moose hair, porcupine quills, &c., used by the N. American Indians as an emblem of peace. It is held sacred to occasions of treaty-making, and as the 'pipe of peace' passes among the assembled chiefs, each takes a few whiffs, thereby giving a pledge of faith presumed to be inviolable.

Cal'vados, a part of old Lower Normandy, now forming a maritime department of France, lies between the departments of Eure on the E., La Manche on the W., Orne on the S., and is bounded by the English Channel on the N. Area 230 sq. miles; pop. (1872) 454,012. C. has mainly a flat surface, is watered by the Touques, Dives, Orne, Seules, &c., and is traversed by the Paris and Cherbourg Railway. The valleys are fertile, and produce corn, hemp, flax, and fruit; but the chief occupation is cattle-rearing and sheep-breeding, and the preparation of butter and cheese. C. has also many iron-foundries, coal-pits, and cotton-factories. The capital is Caen, and among the large towns are Bayeux, Pont L'Eveque, and Vire. The coast, which has few indentations, is rendered dangerous by its cliffs, sandbanks, &c. A long sunken reef, called *Rochers du C.*, from the name of one of the Armada ships wrecked here, gives to the department its name.

Calvaert, Dionys, the leader of the Bolognese school of art immediately prior to the rise of the Caracci, born at Antwerp in 1555, settled, at an early age, at Bologna, where he has left much good work, but is less known for the merit of his own pictures than for the celebrity of his pupils, among whom were Guido, Albani, and Domenichino. His best works are a 'Saint Michael' and a 'Purgatory,' both preserved at Bologna, where C. died, 1619.

Cal'vary is the Latin word *calvaria*, equivalent to the Greek *kranion* ('a skull'), used in Luke for the Hebrew *golgotha* ('of a skull') in Matthew, Mark, and John, and is applied to the place just outside Jerusalem where Jesus Christ was crucified. The popular notion which regards it as a mount is without any foundation.

Calventu'ra, or **Broken Islands**, nine in number, lie in the Bay of Bengal, 6 miles off the coast of Burmah, on the parallel of Bassein. The two nearest the shore are fertile, and are considerably the largest, though they have only a united area of some 4 sq. miles.

Cal'vi, a fortified seaport on the W. side of Corsica, in the Gulf of C., 38 miles W.S.W. of Bastia, with a good export trade. Pop. (1872) 1969. It was taken, after a siege of fifty-one days, by the English in 1794. Another C., the ancient *Cales*, is a town of S. Italy, province of Caserta, where the French gained a victory over the Neapolitan troops, 9th December 1798.

Cal'ville, a kind of apple, of which there are numerous varieties. Its flavour somewhat resembles that of the strawberry or raspberry.

Calvin, John (whose original name was *Jean Cauvin* or *Chauvin*, Latinised into *Calvinus*), was born at Noyon, in Picardy, 10th July 1509. Having been from an early age destined for the clerical profession, probably on account of his correct conduct and religious susceptibilities, he was presented with a benefice at the age of twelve. By means of the income derived from this nominal office, he was able to proceed to Paris and enter on a course of regular study. At this period he was remarkable for his precocious intelligence and the wonderful progress he made in his

studies. About the age of twenty he obtained first one and then another living in the Church; but his studies for the Church were now interrupted for a time. There was at that time studying in Paris a fellow-townman and old companion, Pierre Robert, afterwards known as Olivetan, who had imbibed Reformed opinions on the subject of religion. C. was influenced by him so far as to take a distaste for the Church; about the same time his father came to the conclusion that the law would be a more profitable profession for him than divinity; so that, well pleased with his father's notion, he went to study law at Orleans. There he made such progress in his studies that very soon he was oftener employed as a tutor than as a student. He soon removed to the University of Bourges, where he was greatly helped by Wolmar, the Professor of Greek, the tutor of Beza, and one of the Reformed party. This worthy man gave him instruction in Greek, then a language understood only by the very learned, encouraged him in the study of the Scriptures, and confirmed him in his dissatisfaction with the Church of Rome.

On the death of his father he settled at Paris, where he became known as a Huguenot, and he would have been in considerable danger had he not been protected by the Queen of Navarre. A discourse which he wrote in 1533 drew upon him the charge of heresy from the Sorbonne, and he was obliged to flee. Under an assumed name (D'Espeville or D'Happeville) he withdrew to Angoulême, and spread the Reformed doctrines in Poitou and Saintonge. After some little time he returned to Paris, but soon found it advisable to quit France altogether, which he did at the age of twenty-five (1534), and settled at Basel.

When the French King was appealed to by the Lutheran German princes, his allies, regarding his violence against the French Protestants, he informed them that 'the French heretics had no resemblance whatever to the Lutherans, and that they were not mere seekers of reformed religion, but men disaffected to the state, enemies to law and property, firebrands, and Anabaptists.' It was in answer to this slander that C. prepared his *Christiana Religionis Institutio*, the greater part of which was composed in his retreat at Angoulême, and which, considering its excellent Latinity, its severe logic, and its range and force of thought, as well as its fame and effects, must be regarded as perhaps 'the most wonderful literary production by a young man under twenty-six recorded in history.' It was published at Basel, first anonymously, in 1535, and then in 1536 with his name and a preface, in which he dedicated it to Francis, and defended the Protestants in reference to the charges made against them by the King. Immediately after the publication he left Basel, travelled in Italy, visited Paris, and was returning to Basel through Geneva when he was stopped at that place. At Geneva the Reformed religion had been legally established, its chief expositor being Farel (q. v.), with whom Viret (q. v.) had at first been associated; but as the latter was absent from Geneva at the time, Farel was greatly in need of help, and C. was induced to take Viret's place. The story usually told about the forcible entreaties which Farel found it necessary to use on the occasion, does not seem natural or probable, considering C.'s character and the position he was in and aspiring to at the time. At any rate, he settled at Geneva in September 1536, and from that time became the head of the French Protestants. He was their guide and counsellor, and so great was his influence with them, that towards the middle of the 16th c. they got the name of Calvinists.

In conjunction with Farel, C. now drew up a plan for the government of Geneva, which was passed into law; but which, when the attempt was made to put it into execution, was felt by the citizens to be so intolerable that they rebelled, and drove Farel and C. from the city (1538). C. then took up his abode at Strasburg, and became pastor of a congregation there. At the same time he kept up his interest in the Genevese, and by his letters effectually counteracted the vigorous efforts which were made after he left to bring them back to the fold of the Romish Church. The consequence was that in 1541 he was invited back to Geneva, and at once became the virtual ruler of the city, and so he remained till his death, 25th May 1564.

The idea that C. desired to carry out in the government of Geneva was the same which Augustine held—namely, that of a Theocracy; and his aim and ambition was to make it a model city, an example to the whole world. The Church was over all, and the civil power was simply her instrument in enforcing her

moral code; the anomaly of the system being, that the authority of the Church was made to extend not only over her own members, but over the whole community. The government was administered by a consistory composed of six ministers and twelve elders, who met every week, and inflicted severe penalties on offenders against the moral law, as well as against the strict rules drawn up for the regulation of conduct and manners.

The character of C. has been very variously judged, for he has been alternately loaded with obloquy by his enemies, and extravagantly eulogised by his friends. On the whole, he seems to have been a man to fear or reverence, but not to love. He had a prodigious memory, a keen understanding, and a will of iron. His habits were frugal and simple to the last degree. The favourite point of attack upon him by his enemies, as well as that which his friends have felt most embarrassment in defending, while impartial writers speak of it as the one blot on his character, is the burning of Servetus (q. v.). The defence usually made for the share he is alleged to have taken in the transaction—namely, that he 'acted as informer, prosecutor, and judge'—is, 'that such a thing was then a matter of course, that all parties in those times considered it the duty of the magistrate to extirpate opinions deemed erroneous,' and so forth. Now what we have here to do with are simply facts; and it seems to be at least doubtful whether C. actually played the part which is implied in the discussion. Servetus had previously been condemned by the Catholic doctors at Vienna, rightly or wrongly, for Pantheism and Unitarianism; and it is a remarkable fact that in the 16th c. C. was more strongly attacked by Catholic writers for having solicited his acquittal than afterwards for having condemned him. It further seems in the highest degree improbable that he could have played the part which it is generally assumed that he did, and also have written the following passage, which occurs in his work *a Defence of the Secret Providence of God* (p. 128): 'For what past act of mine you accuse me of cruelty I am anxious to know. I myself know not that act, unless it be with reference to the death of your great master, Servetus. But that I myself earnestly entreated that he might not be put to death his judges themselves are witnesses, in the number of whom at that time two were his staunch favourers and defenders.' Besides the *Institutio*, C.'s most important works are the *De Necessitate Reformanda Ecclesia*; *In Novum Testamentum Commentarii*; and *In Librum Geneseos Commentarii*. The most complete edition is that of Amsterdam (9 vols. 1671), but no thoroughly critical edition of his entire works has yet been published, though one was begun in Germany in 1863, by Baum, Cunitz, & Reuss. There is an English translation, published by the 'C. Translation Society' (51 vols. Edinb. 1843-55). C.'s Letters, collected and edited by Dr Jules Bonnet, have also been translated into English by Constable (2 vols. Edinb. 1855-57). His life has been written by Beza and Bolsec in Latin; by Henry in German, *Das Leben C.'s des Grossen Reformators* (3 vols. Hamb. 1835-44), and by Audin in French, *Histoire de la Vie des Ouvrages et des Doctrines de C.* (2 vols. Par. 1840; 3d ed. 1845).

Calvinism is the system of doctrine professed by the Churches called Reformed, as distinguished from the Lutheran and Anglican, and is so called because based upon Calvin's *Institutes* (see CALVIN). C. is simply a revival of the scheme of doctrine originated by Augustine (q. v.). The two postulates of that scheme were *original sin* depending on the fall, and the *irresponsible sovereignty of God*. From these premises it was argued by Augustine that an absolute election on the part of God of certain individuals to eternal life was not unjust, since, all being transgressors, all might justly have perished; and it necessarily followed that all the rest were *reprobated* to eternal damnation. The character of God as a righteous judge was, at the same time, vindicated, according to the scheme, by the expiation made for the sins of the elect in the *Atonement* (q. v.) of Jesus Christ. And, to complete the scheme, that the elect might be benefited by the atonement, the inclination to appropriate it is produced by the *irresistible grace* of God, which brings them into such a condition that their *perseverance* in holiness is certain, and they cannot finally fall or be lost. Augustine developed his system in upholding *free grace* against *works* in his controversy with Pelagius (q. v.). The same controversy was carried on within the Roman Catholic Church between the Franciscans and Dominicans; it was the subject of

the doctrinal part of the battle at the Reformation, and was kept up even among the Reformers; for Calvin, Beza, and Knox took the Augustinian view, while Luther, Erasmus, Melancthon, Latimer, &c., opposed it. See Hodge's *Systematic Theology* (1873).

Calw, or **Kalw**, a town in the circle of the Black Forest, Württemberg, on the Nagold, about 20 miles W. of Stuttgart. It has cloth and woollen factories, tanneries, dyeworks, cigar manufactories, a fruit-market, and a large timber trade. Pop. (1871) 5582. C. was destroyed by the Bavarian general Von Werth, after the battle of Nordlingen in 1634, and again in 1692 by the French under Melac.

Calycantha'cese, a natural order of shrubby plants resembling the *Rosaceæ* (q. v.), natives of N. America and Japan. There are two genera, *Calycanthus* (q. v.) and *Chemonanthus*, including in all six species.

Calycanthus, a genus of shrubs of the natural order *Calycanthaceæ* (q. v.), found in N. America. *C. Floridus* is the 'Carolina allspice.' Its wood and roots have a camphor-like odour, and are used in the United States as a substitute for cinnamon. It is often cultivated in our gardens. *C. occidentalis* is found in California. The other species are natives of Japan.

Calydonian Boar, according to the Greek myth, a ferocious monster sent by Artemis to ravage the territory of Ceneus, King of Calydon, who had failed to sacrifice to her. Meleager, the son of Ceneus, having invited to his aid the bravest heroes of Greece, slew the boar with his spear, and to him accordingly fell the trophy of the head and skin. A later form of the myth represents Atalanta as having inflicted the first wound, and to have been, on that account, gifted by Meleager with the skin.

Calym'ene, a genus of *Trilobites* (q. v.), or extinct Crustaceans, the fossil remains of which occur from the Lower Silurian to the Upper Silurian. *C. Blumenbachii* is the best-known species. These forms possessed thirteen rings in the exoskeleton or shell, and the body was in many cases indistinctly divided into three lobes. They possessed the power of coiling their bodies up into a ball-like form, after the fashion of the living Woodlice (q. v.). The family *Calymenida* itself includes another genus (*Homalotus*), and the entire family ranges in time from the Lower Silurian to the Devonian formations.

Calyp'so (from *kaluptō*, 'to conceal,' because she kept Ulysses, as it were, hidden from the outer world), according to the Homeric legend, was a daughter of Atlas, and inhabited the island of Ogygia, on the shores of which Ulysses was shipwrecked. Smit with love for the hero, she promised him eternal youth and immortality if he would marry her; but after retaining him for seven years, she was ordered by Hermes to let him go.

Calysac'cion, a genus of plants belonging to the order *Guttifera* or *Clusiaceæ*, which along with those of *Mesua ferrea*, the dried flower-buds of *C. longifolium*, form the *Nagasar*, *Nag-Kesar*, or *Nag-Kassar* of the Indian bazaars, so highly esteemed for their fragrance, and in Bengal as an antidote to snake-bites. *Nag-Kassar* is also used to dye silks.

Cal'yx, the outer covering of the flower, usually green, and composed of sepals, either separate or united (Dialypetalous or Gamopetalous). In the division *Monocotyledons* (q. v.), the C. only is present; in this it is usually bright-coloured. In some dicotyledons (e.g., the fuchsia) it is also *petaloid*. It may remain persistent until the fruit is ripe, as in *Physalis* (the winter cherry), when it is enlarged and bright-coloured; be *caducous*, or fall after the flower expands, as in Poppy; or *deciduous* (falling when the flowering is over), as in *Ranunculus*. In the rose it constitutes the *hip*, the real fruit being the seed-like achenes in the interior. In the apple it also joins the expanded peduncle to form the fleshy portion of the fruit.

Cam (Celt. 'crooked'), or **Granta**, a famous English river, formed by the union of several streams, one of which rises in the N. of Essex. They join near Grantchester, a little to the S. of Cambridge, after which the river, henceforth known as the C., flows N.N.E. past Cambridge, and falls into the Ouse, in the Fen country, after a course of 40 miles.

Cam, in machinery, an irregularly shaped revolving disc, used for imparting motion with definitely varying velocity.

Camaiëu (Old Fr. *camahen*, Low Lat. *camahulus*, a stone engraved in relief, a cameo), and **MONOCHROME** (Gr. 'one colour'), in painting, is a style of producing pictures in one colour only—the different tints of nature being indicated by varying gradations of the single colour, by light and shade, different methods of handling, &c. The paintings of the ancients were executed in that variety of C. or monochrome which is known as *en grisaille*. Drawings in Indian-ink, red chalk, pencil, &c., may be classed as works *en C.*

Camaldolites, an order of monks, now almost extinct, founded in 1018, at Camaldoli, near Arezzo, by St Romuald, a Benedictine, who belonged to the noble family of the Dukes of Ravenna. Originally they pursued a strictly solitary life, but as their corporate wealth increased, they relaxed the strictness of their practice, and divided themselves into recluses, observantists, and conventualists, who, in 1513, were again united into one order under a 'Major,' who lived at Camaldoli. The C. had at one time a footing in France, Germany, and Poland, as well as in Italy. From the first three of these countries they have now disappeared, and even in Italy they scarcely exist. Pope Gregory XVI. was a Camaldolite.

Camarrilla (a diminutive of the Span. *camara*, 'a chamber'), originally denoted the private room of the King of Spain, where he received his intimate personal associates, as distinguished from the *Camara*, the royal or state chamber. The word passed into the political language of Europe, and was then used to denote the secret influence exerted over a monarch by his private favourites in opposition to his public ministry or constitutional advisers. The force of public opinion is happily now so great that not even a Spanish monarch could safely venture to despise it, or lend his ear to mere courtiers.

Camassia, or **Gamassia**, the Camass, or Quamash (as it is sometimes erroneously written), a genus of plants belonging to the natural order *Liliaceæ*, natives of open prairies and grounds in N.-Western America, from California to the northern parts of British Columbia, and from the sea to the Rocky Mountains. The only known species is *Gamassia esculenta*, the bright blue flowers of which give the open country a gay appearance in spring. The plant is about a foot or a foot and a half in height, and has been introduced into our gardens. But it is the bulbous roots that render the plant of most interest. They are collected and stored by the Indians for winter food, and are nourishing from the amount of starch which they contain. The bulbs are dug up with a sharp-pointed stick as soon as the flowering is over. The gamass-gathering is one of the Indian festivals. Numbers gather for this purpose from far and near, and encamp in the woods and plains close by. The work is chiefly done by the women, and, from early morning to dusk, they are busy at it. The young men meanwhile look on, and the hard-working squaw has the best chance of a husband. The roots are cooked by being put into a hole in the ground paved with large stones, in which previously a fire has been lit. The roots are then piled layer upon layer in it, the different layers being separated by leaves and branches, until the hole is full. Earth is then spread over it, and a fire lit on the surface. After they are cooked, they are either pounded into cakes, or more frequently dried for winter use. They are then, by the conversion of the starch into sugar, sweet tasted. There is also a white-flowered variety. See Geyer, Hooker's *London Journal of Botany*; Brown, *Trans. Bot. Soc. Edinb.*, vol. ix.

Camba'cères, Jean Jacques Regis de, a French statesman and juriconsult, was born at Montpellier, 18th October 1753. Adopting the principles of 1789, he was elected (1792) deputy for L'Hérault to the National Convention, which appointed him secretary in January 1793, in spite of the suspicions of the 'Mountain,' excited by C.'s suggestion that the King's execution should be delayed. In this position he denounced Dumouriez, voted against the Girondins, and made, along with Merlin, a report on the civil legislation of the Revolution, in which he proposed to give rights of succession to illegitimate children, and to introduce civil trial by jury. On the death of Robespierre, C. became President of the Assembly and of the Committee of Public Safety, and adopted a moderate policy. In 1795 he was elected Secretary to the Council of Five Hundred under the Directory. Returning to the practice of law in 1797, he again emerged into public life as Minister of Justice under the new

Directory of Sieyès—a post which he retained under the Consulate till he became Second Consul in 1800, Bonaparte and Lebrun being his colleagues. C. firmly opposed the judicial murder of the Duc d'Enghien. He now completed the Civil Code and Code of Procedure. Under the Empire, as Arch-Chancellor, he presided in the Council of State. He was an able administrator, and frequently (as in opposing the divorce and the Austrian alliance) gave the Emperor good political advice. In 1814, C. adhered to the resolution of the Senate recalling the Bourbons. On Napoleon's return, he became nominally Minister of Justice (the work being done by Boulay de la Meurthe). In spite of his moderation during the 'Hundred Days,' Louis XVIII. banished him as a regicide; but in 1818 he was restored even to his title of 'Duc de Parma.' C. died at Paris, 8th March 1824. See Aubriet's *Vie de C.* (2d ed. 1825).

Cambay (Ind. *Kumbaya*, anciently *Khumbavati*, 'the city of the pillar'), a once famous trading town, still the capital of the small tributary state of the *Briue*, lies at the head of the bay of the same name, on the estuary of the Myhee, 40 miles N.N.W. of Baroach. Its only important buildings are the Nabob's palace, and a large and beautiful mosque, originally a Hindu temple. C. is surrounded by a wall 3 miles in extent, with fifty-three towers. It has some exports of grain, cotton, and ivory, but its harbour has filled up with sand of late years. It is celebrated, however, for the manufacture of articles in carnelian and bloodstone. Pop. 10,000. The *state of C.*, feudatory to Bombay, has an area of 350 sq. miles, and a pop. (1872) of 83,494. It pays a tribute of £2700, and supports 800 armed retainers. The *Gulf of C.* (ancient *Sinus Barygaenus*), an inlet on the E. side of the Gujerat peninsula, is about 100 miles long, and from 70 to 20 broad, and receives the Nerbudda, Tapti, Sabarmutti, Myhi, Gooma, Setrooji, &c. In ancient times and during the middle ages, the region round this gulf was the seat of the rich Indian commerce with the Western world.

Camberwell, a suburb of London, on the S. side of the Thames, formerly a rural parish embracing the suburban districts of Dulwich, Herne Hill, and Peckham.

Camberwell Beauty (*Vanessa Antiopa*), a species of Butterflies (q. v.), or Lepidoptera, found in Britain, but more common in Southern Europe, and possessing wings of a dark-brown colour, banded with black, and interspersed with blue spots. A yellow band with black spots encircles the black band. The wing-margin is denticulated or irregularly toothed. The antennæ are terminated by knobs. The larvæ are generally found on the leaves of the willow, and are of black colour spotted with white, and with red spots on the back. The popular name of this butterfly was given to it from its being formerly found among the willow copses of Camberwell.

Cam'bio (Ital. 'exchange') and **Cam'biat** ('money-changer') are terms formerly used to denote a book in which the moneys, weights, and measures of various countries are given in the equivalents of a particular one. The use of Italian terms is explained by the position Italy long held in the European commerce of the middle ages.

Cam'bium (Lat. *cambio*, 'I change'), the viscid, mucilaginous fluid interspersed between the wood and bark of exogenous trees, and particularly abundant in spring. C. cells are formed in it, out of which young wood on one side and young bark on the other are formed, but the nature of the C. is still an undecided question in physiology. See BARK and STEM.

Cambod'ja, a maritime kingdom in the S. of the Indo-Chinese Peninsula, under the protectorate of France, bounded on the S.W. by the Gulf of Siam, and on the S.E. by the French colony of Lower Cochinchina. Area, 32,380 sq. miles; pop. (1874) 888,239, including 40,000 slaves, and 20,000 semi-independent savages, who inhabit the mountains. In the N. and N.W. the surface is mountainous, elsewhere the land is flat, and the soil, mostly a rich alluvium, is abundantly productive. The great rivers Mekong, the Mesap, and their affluents, are the chief streams, and on the N. frontier, partly in C., partly in Siam, is Lake Thalaysap (Sweet-Water Lake), 90 miles in length, 8 to 22 in width, and on an average 6 feet in depth. The principal products are rice, arca-nuts, betel, spices, gamboge, sandal-wood, and ivory. There are extensive forests,

which shelter deer and elephants; horned cattle breed on the plains, and there are hogs, goats, and poultry. Iron occurs.

History.—The Cambodjans know nothing of their origin or early history. According to the Chinese authorities, C., which they name Tchila, began to pay tribute and to send ambassadors to the Son of Heaven as early as A.D. 616. In the 10th c. C. had become a powerful kingdom, and in the 12th c. it conquered Anam, and established itself as the chief power in the Indo-Chinese Peninsula. It was invaded by Kublai Khan in the latter part of the 13th c., and although the great Mongol army was compelled to retire without effecting a conquest, the Cambodjans continued from this date to pay a nominal tribute to China. Early in the 18th c., C., being then hard pressed by the Siamese on the W., called in the aid of the Anamese from the E. The Anamese came to succour, but remained to rule; for, after driving out the Siamese, the King of Anam exacted from the Cambodjans an acknowledgment of suzerainty in 1717. In 1750 the Anamese seized all the provinces lying upon the Saigon river. Near the close of the 18th c., the country came under the protection of Siam. From this period C. continued to be torn and ravaged by Siam and Anam in turn, and in 1809 an Anamese army marched into C., and occupied Penomping, its capital. All the six provinces of which Lower or French Cochinchina (q. v.) consists formerly belonged to C., but were captured by the Anamese, and afterwards compulsorily ceded to the French. From the time that the French first settled upon the peninsula, it was evident that peace and progress were to be secured for the colony only by guaranteeing the independence of C. against the incursions both of Siam and Anam. Accordingly the governor of the French colony of Cochinchina assumed the suzerainty of C. in 1863. See *Travels in Indo-China and the Chinese Empire*, by Louis de Carné (Lond. 1872); Thompson's *Malaysia and Indo-China* (Lond. 1875).

Cam'borne, a town of Cornwall, 4 miles W. of Redruth, and a station on the West Cornwall Railway, lies near the sea, in the midst of a copper, tin, and lead mining district. The town has some good houses, and a fine old granite church, recently restored. Richard Trevethick, the great engineer, was a native of C. Pop. (1871) 7757.

Cam'brai, a fortified city in the department of Nord, France, on the right bank of the Scheldt, 32 miles S.S.E. of Lille. It contains many picturesque old houses, with their gables to the street, and several handsome public buildings, among which are the Cathedral of St Sepulchre, with a fine steeple, the archbishop's palace, the theatre, and the Hôtel de Ville. In 1793 the Revolutionists disturbed the ashes of Fénelon, and converted his leaden coffin into bullets. A monument, by David, was erected in the cathedral to the memory of the illustrious archbishop in 1825. The situation of C. on the Scheldt, here navigable, and its connection with the Ouse and the Seine by the Canal of St Quentin, give it excellent facilities for trade. The manufactures consist of cambric (which derives its name from C.), lawn, lace, linen thread, cotton yarn, beer, brandy, soap, beetroot sugar, &c., and there is besides a trade in corn, wool, cattle, iron, hops, &c. Pop. (1872) 19,156. C., the ancient *Camaracum*, was a city of the Nervii, and, after the Roman conquest, one of the most important towns in Gaul. It has been the seat of a bishop since 390, and of an archbishop since 1559. Maximilian I. made himself Duke of C. The duchy next passed to Spain, and finally, in the reign of Louis XIV., to France. C. is historically celebrated for the *League of C.*, formed in 1508 by the Emperor of Germany and the Kings of France and Spain against Venice, and for other political treaties. In 1815 the city was taken by the British by escalade, and from that time till 1818 was one of the principal stations of the army of occupation.

Cam'bria, a Latinised form of the Celtic *Kymru*, meaning the country of the *Kymry* or Welsh. It is now used exclusively to denote the principality of Wales, but in the early part of the middle ages the Latin chroniclers also applied it to the northern Cymric kingdom of Strathclyde, or *Cumbria*. C. was first called *Welhas* ('the land of strangers') by the English intruders. It was the last refuge and stronghold of the Britons when driven from the lowland districts of the E. From the 7th or 8th c. the limits of C., N. and S., were the same as now, but it extended farther E., though it is impossible to define exactly where it touched upon the English Mercia (*Markland*, i.e., the land bordering on the Kymry).

Cam'brian Rocks, the name given to certain old rocks of the Palæozoic or most ancient period of geology, from the fact of their being specially developed in N. Wales and its borders. They exhibit a division into lower and upper strata, and are well developed both in Europe and N. America. In Britain the Lower Cambrians are well seen in the Longmynd Hills of Shropshire, where they attain a thickness of 25,000 feet, of coloured sandstones, grits, and shales, containing ripple-marks and rain-prints, but few fossils. The Upper Cambrians average from 2000 to 6000 feet in thickness, and consist of flagstones, slates, and shales. In these rocks, the Brachiopod (q. v.) shell *Lingula* attains a great development. The C. R. may thus be divided, in Britain at least:—*Lower C.*—(1) Longmynd Beds (25,000 feet); (2) Llanberis Slates (3000); (3) Harlech Grits (6000); (4) *Oldhamia*, Slates of Ireland. *Upper C.*—(5) *Lingula* Flags of Wales (6000); (6) Tremadoc Slates (2000); (7.) Skiddaw Slates (7000).

Cam'bric, a term applied generally to fine linen fabrics. Switzerland is famous for its cambrics, and in Scotland, an imitation C. is made of cotton, which is twisted hard to make it resemble linen. The term is derived from the name of the French city Cambrai, where C. was first manufactured.

Cam'bridge, the capital of Cambridgeshire, on both sides of the Cam, 51 miles N.N.E. of London, or 57½ by the Great Eastern Railway, and also connected with the Great Northern by a branch line from Hitchin. Several other branch lines connect it with all the important towns in the E. and centre of England. The streets, originally narrow, tortuous, and irregular, have been widened and improved, but the town possesses few features of beauty or interest. From the Gogmagog heights, however, in the neighbourhood, a fine prospect is obtained. Among the churches of C. may be noted that of St Sepulchre, built in imitation of the Holy Sepulchre at Jerusalem, and called from its shape 'the round church,' which was restored in 1843, and St Mary the Great (usually called the University Church, because the University sermons are preached here), with its massive tower crowned with turrets, which was restored in 1863. But the main architectural interest of C. is due to the buildings of the various colleges, which are situated in the W. part of the town, and on both sides of the Cam. C. is a place of great antiquity. It occupies or adjoins the site of the Roman *Camboricum* (itself probably an extension of a British town or place of some kind), and it appears in Domesday Book, and occasionally in the Latin Chroniclers, as *Grantabrigæ* or *Grantabrigæ*, from *Granta*, another name of the Cam. The town was twice burned by the Danes, in 871 and in 1010. William the Conqueror founded a castle here to overawe the English, who still held out in the neighbouring Fen-lands. The rise of the University in the 12th c. was marked by frequent feuds between the 'town' and 'gown,' and on one occasion (1381) the burgesses burnt the charters and records of the colleges, for which they were severely punished by the King. In the civil wars C. was garrisoned (1643) by Cromwell, and held for the Parliament. It has several endowed free schools, and a grammar-school founded in 1615 by Dr Perse of Caius College, a free library, a working-men's college and reading-room, and numerous charitable institutions. C. has no manufactures, but carries on a considerable trade with the port of Lynn. It returns two members to Parliament. Pop. (1871) of parliamentary borough, 33,996; of municipal borough, 30,078. C. is the birthplace of many famous men—e.g., Sir John Cheke, Jeremy Taylor, Richard Cumberland, and Orlando Gibbons.

Cambridge, a city of Massachusetts, United States, is separated from Boston by the Charles river, which is here about one mile in width. It is divided into Cambridge Port, East Cambridge, and Old Cambridge. In the latter is situated Harvard University, the oldest college in the United States, founded in 1638, and possessing (1875) 56 professors, and 1161 students, with departments in arts, medicine, law, divinity, and science, and about a million dollars in endowments. C. has a court-house and jail, some handsome churches, and many beautiful private mansions. The poet Longfellow and several other literary men reside in C., and in the vicinity is the beautiful cemetery of Mount Auburn. Pop. (1875) 39,634. C. was first settled in 1631.

Cam'bridgeshire, an English county in the basins of the Nen and Great Ouse; area, 820 sq. miles; pop. (1871) 186,906. The surface is level, thinly wooded, and marshy, the fens being

liable to floods. The pastures are excellent, and C. is famous for its butter and cream-cheese. The downs towards the S. support numerous sheep and cattle. The Fens, that part of the county N. of the Ouse belonging to the Bedford Level, are a maze of canals and ditches; the soil is a rich black mud, full of vegetable matter, and when properly treated produces heavy crops of oats, wheat, barley, beans, flax, and cole for sheep-feeding. The only manufactures of note are paper and coarse pottery. The principal rivers are the Ouse, which crosses the centre of the county, and is navigable; the Cam, a tributary of the Ouse, and navigable to Cambridge; and the Nene or Nen, also navigable. The chief towns beside the capital are Ely, Wisbeach, and Newmarket. There are numerous Roman remains; and several extensive earth-works, the most notable of which is the Devil's Ditch near Newmarket, are probably anterior to the Roman occupation. The county is also rich in ecclesiastical architecture, of which Ely Cathedral is perhaps the finest example. C. returns three members to Parliament.

Cambridge, University of, was from an early period (how early is not known) the residence of numerous students, who at first lived in hired apartments. About the middle of the 13th c. they began to congregate in hostels under a principal. This may be considered the beginning of the university system. The first charter, that of 15th Henry III. (1231), granted the privilege of appointing taxors to regulate the rent of lodgings hired by the students. It recognises a chancellor, masters, &c.; but the first college, Peter House, was not founded till 1257, and not endowed till 1282. The establishment of endowed colleges gradually extinguished the hostels, the last being Trinity Hostel, which survived till 1540. Edward III., in 1333, granted the university some important privileges; Pope Martin V., in 1430, vested in it exclusive ecclesiastical and spiritual jurisdiction over its scholars; and by the Act of 13th Elizabeth, c. 29, it was incorporated under the name of 'The Chancellor, Masters, and Scholars of the University of C.' At present it comprises seventeen colleges, viz. :—

	Founded.	Undergraduates in 1875.
St Peter's College, or Peter House	1257	37
Clare College	1326	85
Pembroke College	1347	78
Gonville and Caius College	1348	139
Trinity Hall	1350	140
Corpus Christi	1451	144
King's College	1441	28
Queen's College	1448	38
St Catherine's Hall	1473	57
Jesus College	1490	144
Christ's College	1505	108
St John's College	1511	381
Magdalene College	1519	50
Trinity College	1546	522
Emmanuel College	1584	63
Sydney Sussex College	1598	46
Downing College	1800	51

To these must be added 82 non-collegiate students.

Each college is bound by its own statutes, but is subject to the general statutes of the University, which were confirmed by an Order in Council, July 31, 1858. The senate, which is the governing body, assembles in the senate-house; the chancellor, high-steward, vice-chancellor, commissary, and assessor are invested with the executive authority, and the senate expresses itself on public occasions by the mouth of the public orator. The discipline and morals of the students are superintended by the proctors, and the public records are in charge of the registry. There are three terms—the Michaelmas term, extending from the 10th of October to the 16th of December; the Lent term, from 13th January to the Friday before Palm Sunday; and the Easter term, from the eleventh day after Easter Sunday to the Friday after the first Tuesday in July. Before proceeding to the examination for the B.A. degree, the candidate must have resided the major part of ten terms. A further residence of three years is necessary to procure the degree of M.A. The candidates aim either at honours, or merely at the 'pass' degree. These last, being much the more numerous, are known as the 'hoi polloi,' or 'the many.' Originally there were only two

Triposes for honours, the Mathematical and the Classical. The successful candidates under the first are arranged in the order of merit thus :—Wranglers, Senior Optimes, and Junior Optimes, the candidate who has distinguished himself most highly being called the Senior Wrangler. The Smith's prize, for excellence in mathematics, is occasionally wrested from the senior wrangler by some one of those near to him in the Tripos. In the Classical Tripos the names are arranged in the first, second, and third classes, the best man being known as First Classic. There are also a Moral Science Tripos, a Natural Science Tripos (examinations for honours in which were commenced in 1851), a Theological Tripos, and a Law and History Tripos. The students are classed as (1) *Fellow-Commoners* and *Noblemen*, who dine at the Fellows' table, have a somewhat different academical costume, and pay larger fees; (2) *Pensioners*, who pay for their own commons and chambers, and are not in any way assisted by the foundation; (3) *Sizar* (servitors), once bound to perform certain menial offices, from which they are now relieved, who are charged at a lower rate than the pensioners, and for whom there are liberal endowments in several of the colleges; and (4) *Scholars*, chosen by examination, who have free commons and chambers, and other privileges. The fellowships are numerous and valuable, varying from £100 to £300 in yearly value; while some of the senior fellowships exceed £500. The early conditions of tenure as to marriage and orders have been much modified and relaxed of late. The U. of C. returns two members to Parliament. Much improvement has lately been made on the university and college buildings. In 1861 Dr Whewell erected a hostel for the students of Trinity at a cost of £10,000, a wing was added to the university library in 1865, and St John's, St Peter's, Queen's, and Caius, have been partly rebuilt or restored. See Mullinger, *The University of C. from the Earliest Times to the Royal Injunctions of 1535* (Camb. 1873), and the *C. Calendar*.

Cambuslang', a town of Lanarkshire, Scotland, in a parish of the same name, on the Clyde, 3 miles S.E. of Glasgow, on the Clydesdale line of the Caledonian Railway. Pop. (1861) 749; (1871) 2104, mostly engaged in coal-mining. Here in 1741 Whitefield (q. v.), the great Methodist preacher, produced a profound impression, which led to one of the most extraordinary religious 'revivals' that ever took place. In many cases 'conversion' was followed by violent physical convulsions.

Camby'ses (Pers. *Kabujiya*), King of the Medes and Persians, was a son of Cyrus the Great, whom he succeeded, B.C. 530. In 525 he invaded Egypt, of which a single victory at Pelusium over King Psammetichus made him absolute master. He afterwards warred unsuccessfully against the Ethiopians, the Cathaginians, and the Ammonians. Irritated by this, his constitutional tendency to insanity was aggravated, and he ruled Egypt with excessive rigour; but the accounts of his cruelties and excesses, coming from Egyptian priests, are probably somewhat highly coloured. Whilst marching through Syria to punish a pretender to his throne, he died of an accidental wound in the thigh, B.C. 521.

Cam'den, a city and port of entry in New Jersey, U.S., on the left bank of the Delaware river, opposite to Philadelphia, with which it is connected by five ferries. It is the terminus of the Cape May, Melville, and West Jersey Railways, has extensive ironworks at Kaighn's Point, several shipyards and foundries, and manufactures of machinery. Pop. (1870) 20,045.

Camden, Charles Pratt, Earl of, a famous English judge, was the son of Chief-Justice Sir John Pratt, and born in 1714. He studied at Eton, King's College, Cambridge, and Lincoln's Inn, being called to the bar in 1738, entering Parliament in 1754 as member for Downton. C. filled in succession the offices of Recorder of Bath, Attorney-General, Chief Justice of the Common Pleas, Lord Chancellor, and President of Council, holding the last under both Rockingham and Pitt. He made himself extremely popular by espousing the side of the people as against that of the court in the case of Wilkes, and by his action in opposing the policy of Lord North in regard to America. C. was raised to the peerage as Baron C. in 1765, and in 1786 was created Earl C. and Viscount Bayham. He died April 13, 1794.—His eldest son, **John Jeffreys Pratt**, born 1759, filled numerous important offices during a long and honourable political life, including those of Lord-Lieutenant of Ireland, Colonial Secre-

tary, and President of the Council, and in 1812 he was made a marquis. He died 8th October 1840.

Camden, William, an illustrious English antiquary and historian, was born in London, 2d May 1551. Educated at Christ's Hospital, St Paul's School, and Oxford University, he became, in 1575, second master of Westminster School; and it was while holding this post that he published in 1586 his celebrated work *Britannia*, written in Latin, which gives an account of the British Isles from the earliest ages. The work has been added to by subsequent writers, and has passed through a number of editions. It has all the stately pomp and patriotism of the English Elizabethans, and is a noble specimen of learning devoted to a national purpose. The first English version of the *Britannia* was published in 1610; the next, by Bishop Gibson (with additions), appeared in 1694, and has been frequently reprinted; a third by Gough, in 3 vols. folio, is of date 1789. C. became head-master of Westminster School in 1593, and published a *Greek Grammar* for his boys in 1597, and in the same year became Clarencieux King-at-Arms. He died at Chiselhurst, in Kent, 9th November 1623. A society, known as the C. Society, founded after his death, still flourishes, its object being to publish early historical and literary remains. A Professorship of History was also endowed by C. in the University of Oxford. He was the author of several works besides *Britannia*, among the chief being *Annales Rerum Anglicarum et Hibernicarum regnante Elizabetha* (1615; Eng. transl. 1630), *A Narrative of the Gunpowder Plot* (1607), and *An Account of the Monuments and Inscriptions in Westminster Abbey* (1600).

Cam'el ('the bearer,' from the Arab. *chamal*, 'to bear'), a genus of *Mammalia* included in the *Ungulate* or *Hoofed* order of that class, and in the *Ruminant* section of the order. The camels are *Artiodactylate*, or 'even-toed' Ungulates, in that they possess but two toes, covered by imperfect hoofs, or nails. The feet are elongated, and their soles are covered by a horny pad of integument joining the two toes, and forming a flat sole on which these animals walk. The hinder or

Camel.

rudimentary toes seen in most other ruminants are wanting in the camels, which also are devoid of horns, and the nostrils can be closed at will. In their dentition the camels also present certain differences from that of other ruminantia. The upper incisors resemble the canine teeth, and upper canines are present in addition—the typical ruminants wanting both upper incisors and canines. The family *Camelidae*, or camels, also includes the genus *Anchenia* or Llamas (q. v.), which are distinguished from the camels by their smaller size, by their habitat (S. America), by the separation of the two toes, by the want of humps, by the cleft mobile upper lip, and by the possession of two teats only.

Of the genus *Camelus* or true camels, which inhabit Asia and Africa, only two distinct species are known. These are the Arabian camel or dromedary (*Camelus Dromedarius*), which possesses but one hump, and the Bactrian C. (*C. Bactrianus*), which possesses two humps. These humps are simply collections of fat, which during long hunger or privation disappear by absorption, and thus constitute sources of food supply to these animals, which, from their powers of traversing long arid tracts of sand and desert without adequate food and rest, are extensively employed both as beasts of burden and for riding, chiefly by the Arabs. A good riding C. has been known to travel 115 miles

in eleven hours. The paunch or first stomach in the camels possesses large cells, in which water can be stored and carried for use on the long journeys undertaken by these animals. The chest, shoulders, and knees also possess callous pads, on which these animals rest when they lie down.

The Arabian C. inhabits N. Africa and the S.W. parts of Asia. It has been introduced into Europe, but rarely breeds in the latter continent. The Bactrian C., which is generally of larger size than the Arabian species, inhabits Central Asia, Persia, and the tract between the Caspian and Black Seas. This species is often interbred with the Arabian C., and appears of hardier constitution than the latter form. It can carry a load of from 1000 to 1500 lbs. weight. These animals produce usually only a single young at a birth, and the female goes about twelve months with the young. The hair is long and soft, and is woven into a strong cloth fabric. The milk is also used by the Arabs.

The fossil remains of two extinct species of camels occur in the tertiary deposits of the Siwalik Hills of Hindustan.

Cam'elford, originally *Gafulford*, 'the tribute ford' (the *Camelot* of Arthurian romance), an old town of Cornwall, on the Camel, 16 miles W. of Launceston, the scene of the legendary battle between King Arthur and his nephew Mordred. The ruined Tintagel, Arthur's Castle, stands 4 miles to the N.W., on a precipice overhanging the sea. Here the men of Devon fought the Britons of Cornwall in 823.

Cameli'na, a genus of plants belonging to the natural order *Crucifera*, containing two or three European and N. American species. *C. sativa*, the 'Gold of Pleasure,' is the most interesting species. It is a native of Central and Southern Europe and temperate Russian Asia, but is only a questionable native of Britain. It is cultivated on the Continent for the sake of its seeds, which are a valuable food for cattle, for the oil which they contain, and on account of the fibre which is obtained from its stems. The seeds are sometimes erroneously called 'dodder seeds.' The origin of the English name is unknown.

Camellia, a genus of plants of the natural order *Ternstroëmiaceæ* (q. v.), nearly related to the Tea genus (*Thea*), the difference being only in the number of the floral organs and the position of the flowers. C. is found in China, Japan, Cochinchina, the Himalayas, Java, Borneo, and Sumatra. *C. Japonica* of our conservatories is the best-known species. It has been cultivated in China and Japan from the earliest times. In 1739 it was introduced into Britain. Various others have since then been imported and cultivated. *C. reticulata* is a native of Hong-Kong. *C. Sasanqua* is found in Japan and China. From the crushed seeds an oil is obtained in China, and is used for various domestic purposes. A decoction of the leaves is used by the Japanese women to wash the hair, and the dried leaves are mixed with those of the tea-plant in order to impart to the infusion their pleasant odour. The seeds of *C. drupifera* also yield an oil used in medicine in Hong-Kong. It is also found in the Eastern Himalayas. *C. lanceolata* is a native of Sumatra and Borneo, and *C. quinosaurea* of Java. The care which has been bestowed on the cultivation of these plants is owing not only to the beauty of their flowers, but also on account of their value from flowering in autumn, winter, and spring. Loose black mould, mixed with a little sand and peat, is about the best soil to grow them in. Free access of air and liberal watering are necessary to their growth; they do not require a high temperature, but cannot bear frost, and cultivators differ as to whether they should be exposed to the action of sunshine or not. C. is named in honour of Kamel, or Camellus, as his name was Latinised, a learned Jesuit traveller in the East.

Camelopardalis. See GIRAFFE.

Camel's Thorn (*Alhagi*), a genus of plants belonging to the natural order *Leguminosæ* (q. v.), sub-order *Papilionaceæ*, the species of which are mostly herbaceous, or half-shrubby plants. *A. camelorum* yields a kind of Manna (q. v.), in the form of a honey-like exudation from the leaves. *A. Nepalensis* yields a similar exudation.

Cam'eo, a term applied to minute relief sculpture on gems, shells, &c., as contrasted with an *intaglio*, which is sunk into the gem. Much doubt exists as to the derivation of the term, and many fanciful explanations have been offered to account for it.

Most probably it is derived from the Arabic *chemia*, 'a charm.' So far back as the year 1343, we find the great C. of Ste. Chapelle in Paris spoken of as *Le Camahieu*. The glyptic art, or gem-cutting, claims a high antiquity; it was practised by the Egyptians, and was carried to its highest perfection by the Greeks and Romans. Camei, which were used for ornamenting golden cups and pateræ, or as personal ornaments, were rarely produced as compared with intagli, which served as seals; therefore antique camei are much more valuable at the present time than intagli. The sardonyx, a gem formed of black, or dark brown, and white layers, alternating with a layer of carnelian, was most esteemed by ancient artists for camei, as scope was afforded for treating distinct parts or different elevations of a design in various colours. For example, in engraving a head upon a three-banded onyx, the undermost layer served as a background, and enhanced the relief of the face cut in the middle band, while the uppermost was taken advantage of to represent the hair, wreath, drapery, &c. The onyx and various other chalcedony stones of single hue were also employed by the ancients in gem-engraving, and frequently bands of different colours were artificially produced. (See BURN'T STONES.) A vast number of antique intagli and camei, many of exquisite beauty in minuteness and execution, are scattered through national museums and private collections in Europe. The finest specimen of the glyptic art extant, a C. known as the 'Gemma Augustæ,' is now in the Imperial collection at Vienna. In England, the Marlborough, now (1875) in the possession of Mr Bromilow, Battlesden Park, Bedfordshire, the Bessborough, Devonshire, and Carlisle collections are rich in antique gems. The first-named includes the most famous C. in this country, representing Cupid and Psychè, the work of a Macedonian artist. During the dark ages which followed the decline of the Roman Empire, the glyptic art was lost; it was, however, revived in Italy during the Renaissance period of the 15th and 16th centuries, and through many vicissitudes it has survived to the present day, being practised to a slight extent at Paris and in Italy.

Shell Cameos.—The scarcity of gems suitable for cameos led Italian engravers early in this century to resort to shells that present layers of different colours, for the continuance of their art, and now the shell-C. industry is extensively practised at Paris as well as at Rome. The shells best adapted for C.-engraving are the 'Bull's Mouth' (*Cassis rufa*) and the 'Black Helmet' (*Cassis Madagascariensis*). These possess respectively a 'sardonyx' and 'onyx' inner layer. The 'Horned Helmet' (*Cassis cornuta*), with a yellow ground, and the 'Queen's' ('onch') (*Strombus gigas*), with a pink ground, are also employed.

Lava Cameos, popularly so called, are abundantly produced in the Neapolitan States from an indurated clay found in volcanic districts. Shell and lava cameos are chiefly mounted as brooches and other personal ornaments.

The pieces of shell and stone (soft) for cameos are shaped to the required form on the grindstone, and are cemented to a stick which serves as a handle for the artist to grasp, while he first traces the design in pencil, then scratches the outline with a sharp point, next develops the figure with very delicate tools of steel wire, flattened and hardened at the end with a carefully sharpened edge, finally polishing with putty powder.

Camera Lucida (Ital. 'light chamber'), an optical instrument which enables any person to sketch an object or landscape with ease and accuracy. There are many forms of this instrument, based upon the original C. L. invented by Dr Wollaston, which consists of a small four-sided glass prism with one right angle, opposite which is an obtuse angle of 135° , and other two angles of $67\frac{1}{2}^\circ$ each. It is mounted for use with one of the sides of the right angle turned to, and perpendicular to, the object to be delineated, the other side forming the upper horizontal surface over which is the eye of the observer. Rays from the object falling upon the perpendicular face enter the prism, and are reflected twice in succession from the two sides forming the obtuse angle, and emerge from the prism perpendicularly to the horizontal surface, entering the eye which perceives the image of the object upon a sheet of paper directly beneath; the outline may then be traced with a pencil. Amici's C. L. has the merit of not straining the eye to see the image and the pencil at the same time so much as Wollaston's. Its form and action are shown in the annexed figure. *ABC* is a triangular glass

prism, right-angled at *A*; *DE* is an inclined glass plate; *lmno* show the course of the rays from the object *RS* to the glass plate from which they are then partially reflected, forming an

Camera Lucida.

image of *RS* which is seen by the eye *F* in the direction *o r s*.

Camera Obscura (Ital. 'dark chamber'), an optical apparatus by which images of external objects are projected on a prepared surface, serving a variety of useful purposes, especially in the art of photography. It was invented in the second half of the 16th c. by Giambattista Porta, of Padua, who first described the optical phenomenon on which the instrument is based. If all light be excluded from a room, except that which is admitted through a small hole bored in the window shutter, an inverted image of the objects outside, directly facing the window, is thrown, in the natural forms and colours, upon a sheet of white paper properly adjusted to receive the light. By the introduction of a convex lens into the aperture, and placing the paper at a distance from the lens equal to its focal length, the image is rendered sharper and more distinct. It is obvious that by means of an instrument embodying the above principle drawings of natural objects may be made with perfect accuracy by mere tracing. The C. O. assumes a great variety of forms, according to the circumstances under which it is applied; its most important and extensive application, however, is in the photographic act. The photographic camera is essentially a very simple instrument; the annexed figure shows a sectional view of one of the simplest form.

Camera Obscura.

It consists of a wooden box having a sliding brass tube in front, containing a meniscus lens, *l*, before which is a diaphragm with a small aperture. The back of the box is provided with a vertical sliding-frame, fitted with a piece of ground-glass, called a *focusing screen*, which can be replaced by another frame of similar dimensions called the *camera slide*, carrying the sensitive plate or paper, shielded from diffused light by a movable shutter. When the camera is required for use, it is brought into focus by gently shifting the lens tube till a distinct picture is obtained on the ground-glass; the camera slide is then inserted in place of the focusing screen. The sensitive surface is meanwhile screened by the shutter in front of it, which, when all is ready, is raised, and after the exposure of the sensitive plate or paper for a few seconds, the shutter is instantly lowered, and the camera slide removed in order that the picture may be developed and fixed. Great perfection has been attained of late years in the construction of the C. O.; portable instruments, carrying all the mechanical and chemical requisites for indoor or field operations, as well as a 'universal' camera, adapted either for portraits, landscapes, or copying, may now be obtained.

Camera'rius, Joachim, originally *Liebhart*, a celebrated German scholar, was born at Bamberg, 12th April 1500. He reorganised the Universities of Leipzig and Tübingen, was the friend of Melancthon, and assisted Luther in the work of the

Reformation. He was a deputy at the Diet of Augsburg. C. died at Leipsic, 17th April 1574. His *Life of Melancthon* (1566; new ed. 1777), followed by a collection of his letters in 1569, are valuable contributions to the history of the Reformation. His *Commentarii Lingua Græca et Latina* (1551) are still esteemed, and his posthumous *Epistola Familiares* reflect much light on contemporary history. The publication of his commentary on Cicero's *Questiones Tusculanae* (1525) brought him into correspondence with Erasmus. The distinguished botanist of the same name (1534-98) was the son of C.

Camerino (anc. *Camerinum*), a town in the province of Macerata, Central Italy, 29 miles W. of Perugia, on the Potenza; is the seat of an archbishop (1787), and has a small university, founded in 1727, and attended by some fifty students. The principal buildings are a cathedral and the archbishop's palace. There is some trade in silk, which the district produces largely. Pop. 6000.

Cameron Highlanders, the 79th Regiment of British infantry, named after Sir Alan Cameron of Erroch, who raised the corps in 1793. The men wear the Highland garb, and the regiment holds most distinguished honours, won in the Peninsula and at Waterloo, and in all the great conflicts in which the British army has been since engaged.

Cameron, John, a scholar of high repute, and a theologian of advanced opinions for his time, was born in Glasgow about 1580, and was educated at its university, in which he held the post of Greek reader in the twentieth year of his age. Going to France in 1600, he was appointed Professor of Philosophy in the University of Sedan. He was afterwards a Protestant pastor at Bordeaux, then Professor of Divinity in the University of Saumur till 1620. Returning to Britain, C. was made Professor of Divinity in the University of Glasgow, but went back to Saumur in less than a year; thence to Montauban, where he filled the chair of Divinity till 1625, when he was assassinated in the street by a zealot who could not endure his political views.

Cameron, Richard, a Scotch Presbyterian minister, from whom the Cameronians received their name, was born at Falkland in the 17th c. When licensed to preach, he made himself so obnoxious to the Government by his opposition to Episcopacy, and his bold assertion of the spiritual independence of the Church, that he was obliged to leave the country and seek a refuge in Holland. Returning to Scotland in 1680, he and about twenty companions entered the town of Sanquhar, and proclaimed that they renounced their allegiance to the King. A price having been set on their heads (£5000 on C.'s and £3000 on those of the others), they fled to the hills, but in July of the same year, at Aird's Moss, they were surprised by a troop of dragoons under Bruce of Earlsall, overpowered, and several of them killed, C. being among the number. See Bell's *Life of Richard C.*, and Walker's *Biographia Presbyteriana*.

Cameronian Regiment, the 26th Regiment of British infantry, raised in Scotland, and mainly recruited from among the West Country people, mostly Hillmen or Cameronians (q. v.), who flocked to Edinburgh during the Revolution of 1688. These zealous sectaries acted under the belief, fostered by the Convention which sat at Edinburgh, that this regiment was to assist in securing the establishment and stability of a government which would administer the affairs of Scotland according to the letter of the Covenants. After distinguishing themselves greatly in the Revolution struggle, the men were sent to the Continent to engage in the wars which William III. had on hand. This was unquestionably a deviation from the purpose for which they were embodied, but they distinguished themselves as greatly as if they had been volunteers, and, to this day, the 26th of the line maintains untarnished its ancient honours.

Cameronians, *The*, were a party of the Covenanters in Scotland, formed in 1680 under the leadership of Richard Cameron and Donald Cargill. In a statement of their principles they disowned monarchy, and expressed their intention to set up another form of government according to the Word of God; and in the Sanquhar Proclamation (see CAMERON, R.) they declared war against the King and all who adhered to him. Cameron and Cargill (who was executed 1681) were succeeded as heads of the sect by James Renwick (executed 1688), and then by Alexander Shields. At the Revolution the three ministers they

had were received into the Established Church, but because the General Assembly did not expressly renew the Solemn League and Covenant the C. would not follow them, and they remained for some years without any minister. The first they got were John Macmillan and John Hepburn, both of whom had been expelled from the Established Church for preaching against the oath of allegiance, and John M'Neill, a licentiate of the Established Church. In 1712 they performed the ceremony of renewing the Covenants. In 1743 their two ministers, Macmillan and Thomas Nairn, constituted a presbytery, and organised a sect, properly called since that time the Reformed Presbyterians, who still deplore the constitution of Church and State established in both kingdoms at the Revolution and the Union, refusing to take the oath of allegiance or exercise the franchise. In 1860 some of the kirk-sessions attempted to prevent the members becoming volunteers on account of the oath of allegiance required to be taken, and the question came before the Synod, which decided (1863) that excommunication for taking the oath should cease. In consequence of this decision there was a small secession; and there now exist two sects bearing the name of Reformed Presbyterians, the one numbering about 45 congregations, the other about 11. The former has just resolved (1875) on union with the Free Church. See Walker's *Biogr. Presbyt.*, Wodrow's *History of the Sufferings*, &c., and Shield's *Hind let Loose*.

Cameroons, the highest mountain range on the whole W. coast of Africa, is situated in the N.W. of Biafra, and culminates in a peak, about 11,000 feet high. The range is of volcanic formation, and its sides are clad with palms, African oaks, and acacias. It was first visited by Captain Burton in 1861. The river C. rises in the mountains of the same name, and enters the Bight of Biafra, in Upper Guinea, by an estuary 20 miles broad. It has only been partly explored, but at a distance of 40 miles from the sea it has a breadth of a quarter of a mile. It flows through an inhabited region.

Camillus Marcus Furius, a distinguished Roman patrician, was appointed dictator, B.C. 396, to crush the revolt of the Veientes. Having captured Veii, he entered Rome in triumph; but being accused of having made an unfair division of the spoils, he went into exile, and was heavily fined. Soon after, the Gauls, under Brennus, having wasted Etruria, and defeated the Romans with great slaughter, advanced against their city and reduced it to ashes, with the exception of the Capitol, which was bravely defended by Manlius. C. was now appointed dictator a second time (390), and recalled from his self-chosen exile. According to the favourite legend, he surprised and completely routed, or, according to another account, bought off the invaders, rebuilt the city, and in a third dictatorship defeated the Volsci and Aequi. In 386, after declining a new dictatorship, he defeated the Antiates and Etruscans. In 368, when the contest between the patricians and plebeians culminated, the senate appointed C. dictator for the fourth time, but he soon resigned. In the following year, dictator now for the fifth time, he defeated the Gauls near Alba, and was rewarded with a triumph. In 365 he died of the plague. See the Roman Histories of Niebuhr and Mommsen.

Camisards. See CEVENNES.

Camlet, or **Camelot**, originally in the East a cloth made of camel's hair, but now of the hair of the Angora Goat (q. v.). British camlets are either of wool, or of wool mixed with cotton or linen, and spun hard.

Camoens, Luis de, the most renowned of Portuguese poets, was born of noble parents, probably in 1525, and studied at the University of Coimbra, where he met, but did not associate with, Ferreira and others of the classical school. After living at Lisbon and Santarem, he served in the fleet during the African war (in which he lost an eye), sailed to Goa in 1553, and obtained some military employment from the Viceroy of India, but was ultimately banished to a small civil post at Macao, where he wrote his great poem the *Lusiad*. In 1569 he returned penniless to Lisbon, where King Sebastiao treated him in the most niggardly manner, published the *Lusiad* in 1572, and lived in the greatest misery till 1579, when he died in a public hospital. C. therefore did not survive the political independence of the country whose gallant history in the Old and New Worlds he has told in his great epic, *Os Lusíadas*, or *The Portuguese (Lusitanians)*. This work (written in Ariosto's heroic rhymed

iambics, and published twenty-one years before Tasso's *Gierusalemme Liberata*) consists of 1102 octavo-stanzas, which recount particularly the voyage of Vasco de Gama, the Portuguese successes in the Indian Seas, the foundation of Goa, the double conquest of Ormuz, and the ruin of Calicut. Bacchus is supposed to thwart Venus to aid the Portuguese, and strangely enough the divine persons of the Christian theology also assist. The European history of the Portuguese is given in the form of a narrative by Gama before the King of Melinda, just as the story of Troy is told to Dido by Æneas. Interspersed through the main poem we find legends like that of the twelve knights of England and that of the marriage of Gama with Thetis. Rich imagination, melodious verse, sustained dignity, and a fervent patriotism, have made C., 'the only poet of Portugal,' a European classic. Among his minor pieces are many beautiful sonnets, *cançãos* or canzonis, in imitation of Petrarch, and lyrical pieces, and a short satire, *Disparates na India*, on the misgovernment of India. He also left some national pieces in a trochaic measure, known as *redondilhas*. In 1817 a splendid folio edition of the *Lusiad* was published at Paris at the expense of De Souza Botelho, and has been twice reprinted. The *Lusiad* has been translated into almost all European tongues. There is considerable spirit, though not much fidelity, in Mickle's English version (1775), while that of Aubertin (1878) is the most scholarly. See Adamson's *Memoirs of the Life and Writings of Luis de C.* (2 vols. 1820); and Lamarre, *C. et les Lusiades* (Par. 1878).

Cam'omile, or **Chamomile** (*Anthemis*), a genus of plants of the natural order *Compositæ*, sub-order *Corymbifera*, several species of which are found in Britain, and some of which are employed in medicine. Among these are the common C. (*A. nobilis*), which is internal, bitter, and aromatic. Its properties are owing to the presence of the oil of C. which abounds in all parts of the plant. An infusion of the dried flowers is employed as an alterative and anti-spasmodic, and as a stimulant of the abdominal nerves. It is also applied to the skin as an anodyne. *Matricaria Chamomilla*, a plant belonging to the same order and possessing similar properties, is often called the 'wild C.' C. is also used (illegally) to supply the place of hops in giving the bitter quality to beer. The other three British species of *Anthemis* (*A. Cotula*, *A. arvensis*, and *A. tinctoria*) are mere weeds. So acrid is *A. Cotula* ('stinking Mayweed') that it will blister the fingers. *A. tinctoria*, as the name signifies, yields a yellow dye. It is a Scottish superstition that toads suck their venom (*venic*) from the C., and also that to lie upon a bed of C. is a sure cure for a headache. It is believed that the more it is trampled upon the better it will grow, a notion often brought into requisition by the old divines. (Hardy, in Johnston's *Botany of the Eastern Borders*, p. 104.)

Camorra's (Ital. *camorro*, 'a peasant'), a secret brotherhood, the members of which were called *Camorristi*, which at one time infested the kingdom of Naples. They plundered the middle and lower classes in every conceivable way, bought and sold almost on their own terms, smuggled goods, and were always ready for any deed of violence or murder. Tolerated by Ferdinand II., they were severely repressed by Francis II., and in consequence co-operated with the Garibaldians for the expulsion of the Bourbons. The government of King Victor Emmanuel has persistently tried to put down the *Camorristi*, after the failure of the attempt to employ its members in the police service. Brigandage in S. Italy is now the outlet sought for their energies by such of the brotherhood as remain loyal to their mischievous traditions. See Monnier, *La C.*, *Notizie Storiche* (Flor. 1863).

Camouflet, a French word (origin unknown) meaning the smoke of a lighted paper, is applied in military pyrotechny to a strong and offensively smelling composition, put up in paper cases, and used by sappers and miners at siege works to blow into the faces of enemies they may encounter during their operations.

Camp (Lat. *campus*), originally the ground occupied by an army at rest. Its signification was soon extended so as to include the tents and other structures for troops. The fortified C. (*castra*) of the Romans was a work of great arrangement and skill. In most cases it was square in form, and surrounded by a fosse, with a stake-fenced embankment inside of it. On each side was a gate, and the interior was divided into streets, the broadest of which, 100 feet wide, ran between the side gates.

The front part of the C. was again equally divided by another street 50 feet wide, parallel to the last, and was intersected by five streets of the same width crossing the intervening street at right angles. This part of the C. was occupied by the two legions that formed the consular army, flanked on each side by the right and left wings, composed of allies. In the back part, a little way behind the centre of the principal street, was the *Prætorium*, or general's tent, which was usually placed on an elevated spot to command a view of the entire camp. On each side, and in rear of the *prætorium*, were the tents and quarters of the troops. The whole interior was surrounded by a vacant space 200 feet wide, between the ramparts and the tents, to facilitate the movements of the troops, and to afford protection from fire and missiles. In choosing ground for a C., it was of the first importance to obtain a site in a favourable position, that could not be overlooked, and where water was easily accessible. Many of the stationary camps (*castra stativa*) of the Romans in this country eventually became towns, hence the common termination *cester* or *chester* in names of places. Ancient British camps seem to have been generally circular in form and very rude in construction. For an account of modern camps, see **ENCAMPMENT**.

Campagna's, a town in the province of Salerno, S. Italy, lies in a mountain region 20 miles E. of Salerno, is a bishop's see, and has a cathedral and some monasteries. Pop. 8192.

Campagna di Roma, an unhealthy and almost uninhabited region of Italy occupying the greater part of the province of Latium, and surrounding the city of Rome. It extends from Ronciglione to Terracina, a distance of 90 miles, and stretches from the Mediterranean inland for some 40 miles. Its surface is extremely flat, and mainly of volcanic formation, affording in some parts excellent pasture. The most healthy places are Tivoli, the Papal palace Sastel-Sandolfo, Ariccia, and Genzano. Besides extinct craters where solfataras abound, the pestilent *aria cattiva* is most prevalent and deadly. Various reasons have been assigned for the mysterious blight which has fallen on this district, but they are all alike vague and unsatisfactory. It is supposed to have been healthy and pleasant in early times from the fact that Domitian and Hadrian built their magnificent villas here; but Livy states that even when cultivated it was malarious. Several attempts have been made to improve it, and the Italian Government allowed Garibaldi to attempt the task in 1875, but his scheme has been rejected.

Campaign, a series of military operations, forming a distinct stage in a war, and undertaken for a definite object. When armies used to go into quarters during the winter, a C. meant only the operations during the summer months, when soldiers were in the field (Lat. *campus*); but now that the field is kept during the winter also, the word has acquired the wider application stated above.

Campan, Madame Jeanne Louise Henriette, née Genest, was born in Paris, October 6, 1752. At the age of fifteen she was reader to the daughters of Louis XV., and afterwards in the household of Marie Antoinette, whom she begged in vain to be allowed to accompany to the Temple. Becoming an object of suspicion to Robespierre, she quitted Paris, and found an asylum at Combertin. Destitution led her to establish a boarding-school at St Germain-en-Laye, where she had for a pupil Hortense Beauharnais. After the battle of Austerlitz, Napoleon appointed her superintendent of the Imperial Institute of Ecrouen, established for the education of daughters of the officers of the Legion of Honour. She died May 16, 1822, at Mantes. Her *Mémoires sur la Vie Privée de Marie Antoinette* (3 vols. Par. 1823), and *Correspondance Induite avec la Reine Hortense*, besides bearing on events and persons of exceptional interest, are written in a clear and natural style.

Campaña, La, a town of Spain, province of Seville, Andalusia, 30 miles E.N.E. of Seville. The chief industries are weaving and brick-making. Pop. 5380.

Campana'rio, a town of Spain, province of Badajoz, 69 miles E.S.E. of Badajoz. It has some manufacture of liuens and ropes, and some trade in corn and wine. Pop. 5400.

Campanell'a, Tomma'so, a Dominican monk of a liberal and philosophical mind, was born at Stilo, in Calabria, September 5, 1568. A follower of Galileo, and a partisan of Descartes'

new philosophy, he incurred the hatred of the scholastics and clergy, and was forced to leave Naples, where he had publicly defended his new theories. Accused and convicted of conspiring against the welfare of Naples, he was confined for twenty-seven years in a Neapolitan dungeon, during which period he suffered torture seven times. Though released by Pope Urban VIII in 1626, the hatred of his persecutors still showed itself; and accordingly he soon repaired to Paris, where he died in 1639. Most of his works were written, and some published, during his imprisonment—e.g., the *Apologia pro Galileo* (1622), *Realis Philosophia Epilogistica Partes Quatuor*, &c. (1623), *Atheismus Triumphatus* (1631), *Philosophia Rationalis Partes Quinque*, &c. (1638), *De Monarchia Hispanica Discursus* (1640), &c. See Baldacchini's *Vita e Filosofia di Tommaso C.* (Naples, 1840), and Symonds' *Sonnets of Michael Angelo and Campanella* (1878).

Campania, a central province of Italy, was bounded on the N. by Latium, on the E. by Samnium, on the S. by Lucania, and on the W. by the Tyrrhenian Sea. It consisted of a great plain (hence its name) stretching from the Apennines to the sea, broken only by a group of volcanic hills, of which Mons Gaurus is the chief, and by the isolated cone of Mons Vesuvius. C. was greatly celebrated for its beautiful scenery and soft climate, and produced wine (such as the Massic, Falernian, &c.), oil, corn, and fruit of rich quality, and in great abundance. The original inhabitants were of the Oscan branch of the Italian family, and after repeated conquests (in historical times, by the Greeks, the Etruscans, the Samnites, and the Romans successively), the people remained essentially Oscan. The chief cities were the capital, Capua (on the Apian Way), Baiæ, Naples, Herculaneum, Pompeii, Nola, Cumæ, &c. The modern name of C. is *Caserta*.

Campanile (Ital. from Low Latin *campana*, 'a bell'), in architecture, a term borrowed from Italy, where it is used strictly to signify a bell-tower belonging to, but detached from, a church. It corresponds to the Gothic belfry attached to both civic and ecclesiastical buildings, and to the steeple of the churches in Northern Europe; but besides usually standing apart from its church, the true C. is distinguished from the bell-tower of the Teutons in being of equal dimensions from base to coping, unsupported by buttresses, and terminated without a spire. The C. is to be seen in most of the famous Italian cities, and that of St Mark has been made familiar to British readers from Mr Ruskin's description in his *Stones of Venice*. Among the most remarkable of the Italian campaniles are those of Cremona, which rises to the extraordinary height of 396 feet; of Florence, designed by Giotto, and 268 feet high; of Bologna, which is 8 feet 8 inches out of the perpendicular. The C., or leaning-tower, of Pisa is 151 feet in height, and 12 feet 9 inches out of the perpendicular. Of this peculiar and interesting structure the columns and capitals are in black marble, and the upper tier is recessed back—a characteristic detail which has recently been repeated in bell-towers erected at Streatham and Wilton.

Campanula (Lat. 'little bell'), the bell-flower, a genus of plants belonging to the natural order *Campanulaceæ* (q. v.).

Campanula Medium.

There are about 200 species, chiefly natives of the N. of Asia, Europe, and N. America, very few being found in the tropics. The flowers of all of them are graceful and attractive, and many are very beautiful. *C. rapunculoides*, or rampion, *C. persicifolia*, and *C. rapunculoides*, are cultivated for the sake of their roots, which are boiled and eaten with sauce, vinegar, or pepper. *C. glauca* is reputed a tonic, and several are said to be antisyphilitic, but the virtues, real or supposed, of all of them are of very little importance. *C. trachelium* was at one time used in affections of the throat, hence its name ('throatwort') and its specific name (Gr. *trachelos*, 'the neck'), but its 'virtues' are only imaginary. *C. pyramidalis*, *C. glomerata*, *C. latifolia*, &c.—in all about seventy or

eighty species—are among those cultivated. The 'Canterbury Bell' (*C. medium*) is probably the best known. Among the nine wild British species, *C. rotundifolia* is the most celebrated. It is the 'Ladies' Thimbles' or 'Blue Bells' of Scotland, and under the latter name it has been sung by many poets. The name is sometimes, though improperly, given to *Scilla nutans* (the wild hyacinth).

Campanulaceæ, a natural order of plants belonging to the division *Dicotyledons*, sub-division *Calycifloræ*, chiefly natives of the temperate regions of the northern hemisphere, a few, however, being found at the Cape of Good Hope. Very few are tropical. There are about 550 species, distributed over twenty-nine genera—such as *Fasione*, *Campanula*, *Adenophora*, *Specularia*, &c. The milky juice of some of them is somewhat acrid, but the roots of several species of *Campanula* (q. v.), those of *Cyphoglandulifera* of Abyssinia, *C. digitata* of the Cape of Good Hope, and some species of *Specularia*, are used in salads, and the fruit of *Canarina campanula* of the Canary Islands is eaten.

Cam'pbell, Family of. See ARGYLE.

Campbell, Sir Colin, Lord Clyde, one of the bravest soldiers and best generals that Britain has produced, was born in Glasgow, 20th October 1792. His father was a cabinetmaker named John MacIver. In 1808 he entered the army as an ensign, taking, to please an uncle, the name of C. He distinguished himself greatly in the wars in the Peninsula, the United States, China, and India, and particularly at the battle of Chillianwallah. On the outbreak of the Crimean war in 1854, C., who had twelve years before attained the dignity of colonel, was appointed to the command of the Highland Brigade, and gained for himself a very high reputation for gallantry and practical skill by his conduct at the battles of Alma and Balaklava, at the latter of which, with nothing more substantial than the 'thin red line' of the 93d Highlanders, he beat back the Russian cavalry. C. was now made major-general, was created a Knight Grand Cross of the Order of the Bath, received the Cross of the French Legion of Honour, and was made Inspector-General of Infantry; while he became popular with his countrymen generally from the care which, like Wellington, he took of his men. C. reached the summit of his fame in 1857, when, as commander of the forces in India, he finally crushed the Sepoy mutiny and saved the English Empire in India. In 1858 he was created a peer under the title of Baron Clyde, while the East India Company granted him an annuity of £2000. He returned from India in 1860, and died 14th August 1863.

Campbell, George, D.D., a distinguished Scottish theologian, was born at Aberdeen, 25th December 1719, studied first law and then divinity, became in 1746 minister of Banchory-Ternan in Aberdeenshire, and in 1759 Principal, and in 1771 Professor of Divinity, at Marischal College, Aberdeen. His death took place April 6, 1796. C.'s reputation rests chiefly upon two works—his *Treatise on Miracles*, acknowledged to be even yet the ablest answer to Hume's celebrated essay, and his *Philosophy of Rhetoric*, long the standard work on the subject, and not yet superseded. He also wrote a *Translation of the Gospels, with Preliminary Dissertations and Notes*. After his death appeared his *Lectures on Ecclesiastical History* (2 vols. 1800), to which a memoir of his life was prefixed.

Campbell, John, Lord, son of the Rev. Dr George Campbell, minister of Cupar, Fifeshire, was born near Cupar, 15th September 1781, educated at St Andrew's, and at the close of the century removed to London, where he was employed as a reporter on the *Morning Chronicle*. He was entered at Lincoln's Inn, November 1800, called to the bar in 1806, became a benchman in 1827, was elected M.P. for Stafford in 1830, for Dudley in 1832, and for Edinburgh, which he continued to represent for seven years, in 1834. Appointed Solicitor-General by the Whig Government in 1832, and Attorney-General in 1834, he was promoted Chancellor of Ireland, and created a peer of England with the title of Baron C. in 1841. In 1846 he published the first series (3 vols. 8vo) of his *Lives of the Lord Chancellors and Keepers of the Great Seal of England, from the Earliest Times to the Reign of King George IV.* The subsequent 5 vols. appeared respectively in 1846 and 1847. His *Lives of the Chief-Justices of England, from the Roman Conquest to the Death of Lord Mansfield*, was published in 1849. In 1850 C.

was appointed Chief-Justice of the Court of Queen's Bench, and in 1859 the Chancellorship of England, the highest honour of his profession, was conferred upon him. He died 23d June 1861. C. has not a great name either in law or literature.

Campbell, Thomas, a favourite English poet, was born July 27, 1777, at Glasgow, where his father was a merchant. C. displayed poetical ability while at college, and studied letters in preference to law during his course at Edinburgh. In 1799 appeared his *Pleasures of Hope*, a work immediately and lastingly successful. In 1802, after visiting the Continent, he published a 7th edition of this early work, along with some of his finest lyrics—*Battle of Hohenlinden*, *Ye Mariners of England*, &c. In 1803 C. married his cousin, Miss Sinclair, and commenced a literary career at London. In 1806 he received a pension of £200, and in 1809 published *Gertrude of Wyoming*, with the exquisite accompaniments of *Lord Ullin's Daughter*, and the *Battle of the Baltic*. A subsequent edition contained the fine ballad of *O'Connor's Child*. After this he travelled abroad, lectured on poetry, and edited periodicals. C.'s later works, chiefly biographical, had in general a chill reception, and were far from sustaining his earlier reputation. In 1827 came the 'crowning honour' of his election to the Lord Rectorship of Glasgow University, an honour which was thrice conferred on him. He died at Boulogne, 15th June 1844, and was buried in the Poet's Corner, Westminster Abbey. C. has a secure place in English literature, but not through his longer works. His *Pleasures of Hope* is a melodious, semi-didactic poem, chiefly notable for puerile bursts of sentimental eloquence; *Gertrude of Wyoming* has some scattered beauties that partly compensate for the tedium of the tale; while *Theodoric* is insupportably dull throughout; but half-a-dozen of his lyrics are unsurpassed in English, and will keep his memory green to the close of time. See *Beattie's Life of C.* (Lond. 1849).

Campbell Island, a small island in the S. Pacific, in lat. 52° 33' S., and long. 169° 9' E., about 450 miles S. of New Zealand. It is a place of some note on account of its fine harbours and its rare flora.

Camp'belton, a seaport on the E. coast of the peninsula of Cantire, Argyleshire, on a beautiful loch, 2 miles long by 1 broad, with a depth of water from 6 to 13 fathoms, and forming an excellent harbour. C. has numerous distilleries; it imports barley and coal, and exports whisky, sheep and cattle, and herrings. C. joins with Ayr, Inverary, Irvine, and Oban, in returning one member to Parliament. Pop. (1871) 6688. The ancient name of C. was *Dalruadhain*, and it was the first residence and capital of the Dalriad Scots. The place retained its ancient name till the beginning of the 18th c., when it was raised to the rank of a royal burgh, and took its present name out of compliment to the Duke of Argyll.

Campeach'y, or **San Francisco de C.**, a flourishing seaport of Mexico, lies on the Bay of C., on the W. coast of Yucatan, at the mouth of the Rio de San Francisco. It is defended by a citadel, and has a college and a theatre. There is an active trade in logwood, wax, cotton, &c. Pop. 15,500. C. was founded by the Spaniards in 1540, and belonged to the English from 1659 to 1678. The surrounding district produces much rice, sugar, salt, and marble.

Camp Equipage, the appliances necessary for military encampment. The phrase refers to the domestic wants of the soldiers rather than to their warlike equipment. Tents, furniture, fittings, and the various utensils included in C. E. are supplied to the army in a fixed proportion to the number of troops.

Camperduin', or **Camperdown**, a small village in the province of N. Holland, Netherlands, 8 miles N.W. of Alkmaar, gives name to a naval victory of the English, under Admiral Duncan, over the Dutch, gained off its coast, October 11, 1797.

Cam'per, Pieter, an able physician, skilful anatomist, learned author, and accomplished artist, was born at Leyden, May 11, 1722. He became Professor of Medicine at Franeker in 1750, at Amsterdam in 1755, and at Groningen in 1765, a post he resigned in 1773. After some time spent in travel, C. was elected a member of the State Council in 1787, and removed to the Hague, where he spent the rest of his life. The theory

of art was advanced by his work on the connection of anatomy and drawing. He died at the Hague, 7th April 1789. C.'s collected writings, *Œuvres qui ont pour Objet l'Histoire Naturelle, la Physiologie et l'Anatomie Comparée* were published (with plates) at Paris in 3 vols. 1803.

Camp Followers, non-combatants who follow an army for purposes of personal attendance, domestic service, trade, and pleasure. They are a necessity in every army, but in India, owing to the habits and customs of the country, they are extraordinarily numerous. When Sir Colin Campbell, on June 2, 1858, marched the final stage for the relief of Lucknow, the C. F. numbered 60,000—consisting of officers' servants, ostlers, cantineers, sutlers, water-carriers, and a host of other less needful persons, male and female. In European armies C. F. are placed under the control of the commanding officer.

Cam'phine, oil of turpentine rectified by redistillation with potash and water. It is employed for burning in lamps of peculiar construction, which supply a well-regulated abundance of air, essential to the complete combustion of the carbon present in large quantity in the oil; otherwise dense smoke is emitted.

Cam'phor, a solid, essential oil, a kind of stearoptine, found in many plants, and capable of being separated from various essential oils, but chiefly obtained by boiling the chopped branches, stem, and roots of the C.-trees, when, after some time, the C. becomes deposited, and is purified by sublimation. The species from whence it is obtained belongs to the order *Lauraceæ* (q. v.), but all used in commerce is the product of *Camphora officinarum* (the *Laurus Camphora* of the older writers), a tree allied to the Cinnamon genus, and a native of China, Japan, Formosa, and Cochinchina, and now naturalised in Java and the West Indies. The flowers and every other part of the tree smell strongly of C., and the wood being light, durable, and not liable to be attacked by insects, is greatly valued by the cabinetmaker. Most of the C. sold in commerce is obtained from the island of Formosa, and is distinguished from other camphors by the name of *Laurel*, *Common* or *Official C.*

Borneo or Sumatra C. is obtained from *Dryobalanops aromatica* or C., a large tree, native in Borneo and Sumatra. From the stem is obtained, by making incisions, a hydrocarbon, with an odour 'resembling a mixture of cajuput oil, C., and cardamoms' (Basley), which is known as *Liquid C.*; it is used for making scented soap. In the fissures and cavities of the interior of the trunk are extracted pieces of the solid *Sumatra C.*, which can only be obtained by cutting down and chopping up the tree. Generally the pieces are small, but sometimes they have been found as large as ten or twelve lbs. The liquid oil can only be obtained from immature trees, while the C. is found in old ones; hence it is probable that the former becomes converted into the latter. It has much the same properties as the common C., but is never seen in commerce in Europe. The Chinese value it so highly as to give eighty or a hundred times more for it than the Laurel C.; accordingly, as it is not believed to differ from the cheaper drug in properties, the Celestials are allowed to monopolise it. They attribute extraordinary properties to it. C. in large doses is poisonous; in smaller quantities it has acrid, stimulant properties, but has no preventive power in infectious disease. The vapour destroys insects; hence the drug is put among clothes and natural history specimens, and the wood is used in making cabinets for holding entomological and other natural history specimens. C. usually arrives in Europe contaminated with various impurities. In order to purify it, it is mixed with lime, and reheated in large glass bolt-heads, when it fuses, boils, and the vapour condenses in the cool parts of the vessel in colourless crystalline masses. C. is readily soluble in alcohol, and may be obtained in brilliant octohedra by slowly evaporating the alcoholic solution; these crystals may also be prepared by slow sublimation, and are frequently found in bottles in which C. has been

Camphora officinarum.

kept for some time, deposited on that side of the bottle which is coolest. C. is very sparingly soluble in water, but, nevertheless, communicates to it its taste and colour. Owing to its toughness, C. is difficult to pulverise, but if a few drops of spirit of wine be poured upon it, it becomes brittle, and may be powdered with ease. C. is combustible, and burns with a sooty flame. If pieces of burning C. be placed on the surface of water, they continue to burn and rotate in a very remarkable manner. C. has the composition represented by the formula $C_{10}H_{16}O$. When heated with dehydrating agents, such as phosphoric anhydride, or chloride of zinc, it loses the elements of a molecule of water, and a hydrocarbon called Cymol results.

Camphor. Water. Cymol.

Both C. and cymol are related chemically to turpentine, $C_{10}H_{16}$. Borneo C., or Borneol, differs from ordinary C. in containing two atoms more hydrogen, its composition being expressed by the formula $C_{10}H_{18}O$. It is obtained from the wood of *Dryobalanops aromatica*, and is usually found in the cavities of the old trees. It may be prepared from ordinary C. by heating it with caustic potash, the potash causing the C. to take up the elements of water, and to yield Borneol and camphic acid.

Camphor. Water. Borneol. Camphic acid.

Borneol forms small transparent brittle crystals, which have an aromatic and peppery odour and burning taste. It has no practical use.

Cam'pi, the name of an Italian family of painters, who established what is spoken of as the school of Cremona, and two of the members of which (Giulio and his cousin Bernardino) are compared by Lanzi to the Caracci.—**Giulio O.** (1502-72), the eldest, and the instructor of the others, studied under Giulio Romano. The Church of St Margaret, of Cremona, was entirely decorated by him. At Milan and Brescia many of his frescoes and pictures are still preserved. His designs are vigorous, and from the study of Titian, Correggio, and Raphael, he acquired a beauty of colour and grace of expression which raised the school of Cremona above that of Mantua. He excels his brothers in grandeur of style and in anatomical knowledge, and yields to Bernardino only in purity of design.—**Antonio O.**, brother of Giulio (born before 1536, and still living in 1591), architect, painter, and author of a History of Cremona, which he illustrated with his own designs in copperplate.—**Vincenzo O.** (1532-91) excelled in portraits and fruit-pieces.—**Bernardino O.** (1525-90), the 'Annibale Caracci' of the school. He studied at Mantua, and copied the 'Eleven Cæsars' of Titian, adding a twelfth, which was in no way inferior to the others. His designs are more timid, but more correct, than those of the brothers C. His chief works embrace his 'St Cecilia,' 'St Catharine,' and the 'Ascension' in Cremona; his 'Saviour,' 'Virgin,' and 'Transfiguration' at Milan, and his 'Virgin Weeping over the Body of the Saviour' in the Museum of the Louvre.

Camp'i'nas, or **Campanha**, a town of Brazil, province of Minas Geraes, 160 miles N.W. of Rio de Janeiro, has an export trade in coffee and sugar. In the surrounding hills are several gold-mines. Pop. 6000.

Cam'pion. See LYCHNIS and SILENE.

Camp'li, a town in the province of Teramo, Central Italy, has a cathedral, an abbey, several convents, and manufactures of straw hats. Pop. 7500.

Campobass'o, a fortified town in the province of the same name, S. Italy, about 53 miles N.E. of Naples. Its situation is favourable for trade, and there are manufactures of cutlery. C. has a cathedral, a ruined castle, and several palaces. Pop. 14,500.

Campobell'o, an island 9 miles long and about 3 broad, belongs to New Brunswick, Dominion of Canada, and lies at the entrance to Passamaquoddy Bay. It has several good harbours, and supports a lighthouse 60 feet above high-water mark at its northern extremity.

Campo de Cripta'na, a town in the province of Ciudad Real, Spain, 75 miles S.S.E. of Madrid, with which it is connected by railway. It has some trade in corn, fruit, wine, and in coarse cloth, which it manufactures. Pop. 3260.

Campo-Formio, a village in the province of Udine, N. Italy, celebrated for the treaty of peace concluded here, October 17, 1797, between the French Republic and Austria, by which the latter power, for resigning the Netherlands and Lombardy, received as a compensation the Venetian states.

Campoma'nes, **Pedro Rodriguez**, Count of, a Spanish statesman and political economist, born in Asturias in 1723, was successively President of the Cortes, Director of the Royal Academy of History, and Minister of State. He died 3d February 1802. C. was an accomplished linguist, but his most valuable labours were his writings on political economy. The chief are *Tratado de la Regalia de Amortizacion* (1765), *Discurso sobre el fomento de la Industria popular* (1771), and *Discurso sobre la Educacion popular de los Artisanos y su fomento* (1775).

Campo Santo, a famous cemetery in Pisa, consecrated to the memory of those who have deserved well of their country, and which has given its name ('Holy Field') to every burying-ground in Italy. It dates from the end of the 12th c., having been consecrated by Archbishop Ubaldo, who, when driven from Palestine by Saladin, loaded his fifty-three vessels with earth of the Holy Land, and deposited it on the place now called C. S. This space is now surrounded by a wall, with an arcade on the inner side, and chapels at the N. and E. ends. The structure was designed by the architect Giovanni Pisano, and erected under his superintendence in 1283. It has on the walls some frescoes dating before the middle of the 14th c., of great value in the history of art, and is in reality a museum of classical antiquities, in which the Pisans have for centuries stored everything interesting or curious—statues, bas-reliefs, inscriptions, sarcophagi, altars, &c.—which has come into their possession.

Campvere' (Dutch *veer*, a ferry, and Campen, the name of a village in N. Beveland), a decayed town of the Netherlands, on Walcheren Island, in the province of Zealand, 4 miles N.E. of Middelburg. It is now called simply Vere or Veere, and has a port on the *Veersche Gat*, which flows between Walcheren and N. Beveland. There are such relics of former prosperity as the town-house with its elegant tower, a fine cathedral, and an hospital. C. has one calico-factory. Pop. (1873) 925. C. has a curious historical interest. In the 17th c. it first proclaimed the Prince of Orange, William III., Stadtholder. Trading connections of a peculiar kind existed between it and Scotland for nearly four centuries; the Scotch staple-right having, in 1444, been transferred from Bruges to it after Wolfard, Lord of Vere, Sandenburg, &c., married Mary, the sister of James I. of Scotland. This right conferred on C. the privilege of receiving and selling first all goods from Scotland destined for the Netherlands. Scotchmen in the town formed a separate community, with many privileges. They had the right to be governed by the law of their native land, and lived under the rule of a 'Conservator of the Scotch Nation,' an office which existed as a sinecure down to 1847, since which time it has been abolished.

Campy'lospermes, a sub-order of *Umbellifera* (q. v.), in which the endosperm of the seeds is rolled inwards at the margins, and presents a vertical furrow on its face. Ex. *Anthriscus*, *Conium*, *Cherophyllum*.

Camtoos', a small river at the Cape of Good Hope, rises in the Nieuwveld range to the E. of Beaufort, is useful for irrigation, and enters St Francis Bay, to the W. of Port Elizabeth, after a course of 200 miles.

Camucci'ni, **Vincenzo**, an Italian painter, was born at Rome about 1775. In youth he painted scenes from early Roman history—'Romulus and Remus,' 'Horatius Cocles,' 'Departure of Regulus for Carthage,' 'Death of Virginia,' 'Death of Cæsar'—in the pseudo-classic style brought into vogue by David in the first French Empire. He also painted many sacred subjects and portraits. His reputation was great, and to worldly riches he added the esteem of all who knew him. But he could not divest his work of pseudo-classicism. The able French critic Pierre Guérin says of him, 'He devours the old masters, but cannot digest them.' C. died 2d September 1844.

Ca'mus, Armand Gaston, one of the most sincere and decided of French revolutionists, was born at Paris, April 2, 1740. Trained to a knowledge of ecclesiastical law, and a keen Jansenist, he rose to the post of Advocate-General of the French clergy. When the Revolution began in 1789, C. threw himself heartily into it, exposed the extravagance of the court of Louis XVI., and sent from Belgium his vote for the King's death. Attempting to arrest Dumouriez (1793), he fell into the hands of the Austrians, who kept him for two years and a half, when he was exchanged for a daughter of Louis XVI. In a short time he was President of the Council of Five Hundred, but resigned, May 29, 1797, to give himself up to literary pursuits. He died of apoplexy, November 2, 1804. C.'s last public act (1802) was to write against Napoleon's proposed consulship for life. His writings, chiefly historical and bibliographical, are not of sufficient importance to merit notice.

Camwood, or **Barwood**, a dyewood yielding a brilliant permanent red colour, and used with sulphate of iron to dye the now almost obsolete Bandana handkerchiefs. It is the wood of *Baphia nitida* (natural order *Leguminosæ*, sub-order *Casalpinia*), a native of Sierra Leone and other parts of Africa.

Ca'na ('the reedy'), a village of Galilee, and, according to John, the native place of Nathaniel, and the scene of our Lord's first miracle. The traditional site is at Kefr Kenna, a village 4½ miles N.E. of Nazareth; but within the last few years it has been thought by some that the ruins of another village 9 miles N. of Nazareth, called Kana-el-Jelil, have a better claim.

Ca'naan. See PALESTINE.

Can'ada, **Dominion of**, the most extensive of the British colonial possessions, is practically coextensive with British N. America. It is bounded E. by the Atlantic, N.E. by Davis Strait and Baffin's Bay, N. by the Arctic Ocean, N.W. by the United States territory of Alaska, W. by the Pacific, and S. by the United States, and by the Lakes Ontario, Erie, Huron, and Superior. Its greatest breadth, from Cape Canso to the mouth of Fraser River, is 2800 miles, and its extreme length, from the United States frontier to Cape Barrow, 1700 miles, while it has a coast-line of at least some 12,000 miles. The W. coast is greatly indented, but has no large inlets; on the E. coast are the Bay of Fundy and the great Gulf of St. Lawrence, which, however, is much surpassed in size by the vast northern inland sea known as Hudson's Sea or Bay. The area is nearly equal to that of Europe, and the following table gives the divisions and populations according to the census of April 3, 1871:—

Provinces.	Area in sq. miles.	Population.
Ontario	121,260	1,620,851
Quebec	120,020	1,191,516
Nova Scotia	18,660	387,800
New Brunswick	27,105	285,394
Manitoba	2,891,734	11,933
British Columbia	213,000	10,586
Prince Edward Island	2,173	94,021
Total	3,483,952	3,602,321

The only portion of British N. America not yet included in the confederation is Newfoundland, but as it is certain in time to throw in its lot with the Dominion, provision was made for its admission in the Act of Union of 1867.

Physical Aspect.—The country is one of vast lakes and magnificent rivers, but is comparatively destitute of great mountains. The only ranges of importance are the Rocky Mountains in the W., the Laurentian range N. of the St. Lawrence, and the Green Mountains in Quebec province, S. of the St. Lawrence. The great western range, which rises upon an elevated plateau, and increases in height from N. to S., runs throughout the whole length of the Dominion in a direction nearly parallel to the coast-line. It consists of three chains, and in the most easterly of these, near the sources of the Saskatchewan, rise Mount Brown (15,990 feet) and Mount Hooker (15,700 feet), the loftiest heights in the Dominion. The Laurentian range, which runs in a direction from S.W. to N.E., forms a natural boundary between Labrador and the provinces of Quebec and Ontario. To the E. of the Rocky Mountains, and extending to the Hudson Sea, is the immense plain of Manitoba, formerly the Hudson Bay Company's territory, bounded N. by the Arctic Ocean, and S. by the United

States, the greater portion of which is merely hunting-ground. This plain consists (1) of a barren, frost-bound polar region; (2) of a fertile tract of prairie land stretching from Winnipeg and Red River to the Rocky Mountains, a distance of 1000 miles, and having a breadth of 350 miles; and (3) of an almost impassable country of rock, river, morass, and forest, lying between the Red River and Ontario. Among the chief lakes of the Dominion are Winnipeg, Athabasca, Slave Lake, and Great Bear Lake. The principal rivers are the Mackenzie, flowing into the Arctic Ocean, and the Saskatchewan, Peace, Athabasca, and Churchill, all threading a string of lakes before entering Hudson's Bay; the Abbatibbe, Moose, Albany, E. Main, and Rupert, rising on the N. frontier of Ontario and Quebec, and flowing into James Bay; the St. John, with a course of 500 miles in New Brunswick, which it partly separates from the state of Maine; and the Ottawa, which waters Ontario, and is the most important tributary of the St. Lawrence. It is, however, the mighty St. Lawrence (q. v.) itself, with its splendid series of lakes, that gives the Dominion, in common with the United States, pre-eminence, in point of hydrography, over every other country in the world. This river, which is of the utmost value to commerce, drains an area of 400,000 sq. miles, and enters the Atlantic after a course of 2000 miles. The five famous lakes, Ontario, Erie, Huron, Michigan, and Superior, have together an area of 120,000 sq. miles, which is about half the fresh-water surface of the globe. By far the most favoured and fertile provinces of the Dominion are Quebec and Ontario, while New Brunswick is densely wooded, and the cultivated parts of Manitoba are singularly productive. The vast peninsula of Labrador, forming the N.E. portion of the territory, and extending N. between Hudson Bay and the Atlantic, is almost uninhabited, and presents a desolate and broken surface. To the W. of the Rocky Mountains, British Columbia, which is watered by the Simpson, Frances, and Fraser, presents a soil admirably suited to the growth of cereals, and is remarkably rich in timber and mineral treasure.

Islands.—The principal islands of the Dominion on the E. are Cape Breton, Prince Edward and Magdalen Islands, and Anticosti, in the Gulf of St. Lawrence. A group of over forty are scattered along the rugged W. coast, and of these the chief are Vancouver, Queen Charlotte, Prince of Wales, Sitka or New Archangel. In the great Arctic Archipelago are Cumberland and Cockburn Islands, Albert Land, Bank's Land, Melville Island, Victoria Land, Southampton Island, and the Parry Isles.

Climate and Botany.—The climate of the Dominion generally is more extreme, both in summer and winter, than that of corresponding latitudes in Europe. The most populous of the provinces are, in this respect, extremely healthy, showing a high rate of longevity. Ontario and Prince Edward Island enjoy the mildest winters in the territory, yet the St. Lawrence is frozen for about five months in the year. Summer, at all times short here, is occasionally oppressive, giving rise to severe droughts; a delightful Indian summer preludes the season of skating and sleighing. During winter there is little rain or wind, and no thaw occurs sufficient to spoil the sleigh-roads. Even when the temperature is very low, the air is bright, keen, and exhilarating. The following table gives the mean temperature in degrees Fahrenheit at various stations throughout the Dominion, taken in 1872-73:—

Province.	Station.	July.	December.
Ontario	Toronto	70°2	18°7
Quebec	Montreal	71°7	13°8
Nova Scotia	Halifax	64°8	22°9
New Brunswick	St. John	60°5	16°3
Manitoba	Winnipeg	67°6	9°0
British Columbia	Spence's Bridge	75°8	21°6

Among the chief obstacles to the agriculturist are the periodical plagues of grasshoppers and mosquitoes, the length of the winter, the want of means of ready communication, the presence of ague-breeding swamps, and the inundation of the rivers on the melting of the snows. The great forests of New Brunswick, Quebec, Ontario, and parts of Manitoba, consist mainly of red and white pine. Among the other forest trees are the oak, ash, beech, cedar, poplar, birch, alder, willow, and maple. Much sugar is manufactured from the maple, and the evergreen balsam-fir (*Abies*

Salsoloma) yields a fine varnish. In the growth of cereals, no country excels Quebec, Ontario, and the Red River Settlement. Wild fruits are abundant, and near the lakes the grape and peach ripen in the open air. The vast prairies of the W. are interspersed with forests, where thickwood plants furnish excellent pasturage. The vetches grown here are as suitable as European clover for the nourishment of cattle.

Zoology, Geology, and Mineralogy.—In Manitoba there are immense herds of buffaloes, and among other animals in the Dominion are the bear, deer, elk, wolf, and moose. The lakes and rivers are amply stocked with fish, including the sturgeon, trout, pike, gold-eyed carp, whitefish, catfish, &c. The Gulf of St. Lawrence is one of the most valuable cod-fishing grounds in the world, and in the N. there are also extensive seal and whale fisheries. The partridge and duck are among the common game, and there are numerous beautifully-plumaged birds, but they are all destitute of song. The geological formation of the region to the N. of the St. Lawrence is that to which the river gives name (*Laurentian*), and is interrupted by masses of granite and veined by syenite and greenstone. One of the chief minerals in the Upper Laurentian of Labrador is *Labradorite*. In the Rocky Mountains the metamorphic gneiss contains talcose slates, gold-bearing quartz, and deposits of silver, &c. The Devonian system occurs in W. Canada, and abounds in fossils. The Dominion is particularly rich in the variety and extent of its minerals and rocks, of which the most important are ores of iron, copper, and lead, coal, limestone, petroleum, serpentine, honestone, marble, roofing slate, building stone, and mill-stones. In Columbia, at the confluence of the Fraser and the Thomson, one of the richest goldfields in the world was discovered in 1860. An auriferous drift covers a wide area on the S. side of the St. Lawrence, and gold has also been found on the St. Francis River, on the Etchimin, on the Chaudière, in the country between Red River and Lake Superior, on the Peace River, and elsewhere. Along the E. base of the Rocky Mountains runs a belt of lignite coal, nearly 1000 miles long, from 2 to 8 feet thick, and having a breadth in some parts of 200 miles. There are also vast deposits of coal in Nova Scotia.

Commerce and Communication.—The increasing prosperity of the Dominion is nowhere more clearly seen than in the steady development of its trade. The value of imports from Great Britain was in 1863 £6,209,046, and in 1873 £14,275,576. There is also a great trade carried on with the United States, the exports to that country in 1873 amounting to £8,448,886. In the same year the total value of exports was £18,706,233, and of imports £26,669,017. The two staple articles of export are wood and breadstuffs. In 1873 the value of timber, chiefly hewn and sawn, exported to Great Britain, was £5,196,083; of wheat, £2,489,272; of maize, £397,465. New Brunswick supplies the greatest quantity of wood, and the valley of the Ottawa the finest quality. Among the other exports are oats, oatmeal, peas, and fish. The imports are mainly iron, wrought and unwrought, and cotton and woollen goods. Montreal is the great commercial centre.

In 1873 the Dominion possessed a network of railways of a total length of 3478 miles, while there was in course of construction other lines to the extent of 1250 miles. Besides this, 3000 miles more had been surveyed, including the proposed railway across the entire Dominion from the Atlantic to the Pacific, towards the construction of which the British Government had consented to contribute a grant in the form of a guarantee loan of £2,500,000. It is designed that the Dominion Pacific Railway shall be carried in its whole length through British territory, and shall be continued from the mainland to Vancouver's Island by means of a bridge at Seymour's Narrows. This line is confidently expected not only to give a vast impulse to the mines and granaries of the W., but to promote a trans-continental trade with Asia. Of the existing railways, the most extensive is the Grand Trunk, which runs in an unbroken line from Portland, in the United States, to Lake Huron and Detroit, crossing the St. Lawrence at Montreal by the stupendous Victoria Bridge. Montreal has direct communication with Halifax and St. John since the recent completion of the Megantic, International, and the Intercolonial railways. The great water-system of C. is perhaps a still more important means of transit, extended and improved as it has been of late years. By the deepening of Lake St. Peter, vessels of 1800 tons can now reach Montreal, and sea-going ships are enabled to avoid the rapids between that city and Lake Ontario by means of canals.

The obstacle to navigation also presented by the Niagara Falls has been overcome by the Welland Canal connecting the lakes Ontario and Erie. These facilities have been further supplemented by similar American works between Lakes Huron and Superior.

Government, Finance, &c.—The constitution is similar to that of the United Kingdom, and the executive authority is vested in the sovereign of Great Britain, who is represented by a Governor-General, exercising authority with the aid and advice of the 'Queen's Privy-Council of Canada,' the members of which body are chosen by himself as occasion may require. The Legislature consists of an upper house or Senate, of 80 members, and a House of Commons, of 205. A bill may be passed by both houses of Parliament, and even be assented to by the Governor-General, and yet be disallowed by the British sovereign in council. Senators are appointed for life by the Governor-General, and must reside in the provinces they represent, and possess 400 dollars of real property. Members of the Lower House are elected for five years, and choose their own speaker. Ottawa is the capital of the Dominion, and the seat of the Legislature.

Each province has its own Legislature and executive, and is presided over by a Lieutenant-Governor chosen by the Governor-General. These local Legislatures levy taxes for provincial purposes, control educational affairs, &c. In the financial year ending June 30, 1875, the estimated revenue of the Dominion amounted to £4,400,000, and expenditure to £4,950,000. The public debt, incurred chiefly on account of public works, and the interest of which forms the largest branch of the expenditure, amounted on 1st July 1873 to £21,935,949. The total charges on the debt during the financial year 1873 were £1,158,002.

Army and Navy.—The defence of the Dominion is provided for by a large volunteer force, a newly-organised militia, and an imperial force, forming the garrison of Halifax, and permanently reduced to 2000 men in 1871. All male British subjects between the ages of eighteen and sixty are included in the militia, which is divided into an active and reserve force. In 1875 the active force was reduced to 30,000 men and officers. The Dominion is portioned into eleven military districts, of which four are formed by Ontario, three by Quebec, and one by each of the other provinces. There are four schools of instruction for infantry. In 1872 the naval force on the great lakes and the St. Lawrence numbered eight armed screw-steamers.

Religion, Education, &c.—The Dominion has had no Established Church since 1853, when the Act of 1823, reserving a certain portion of the land for the support of the Protestant clergy, was repealed. Nine bishops govern the Church of England; four archbishops and fourteen bishops the Roman Catholic Church; and the Presbyterian Church, or rather that portion of it not of Free Church and U.P. origin, was until June 1875 connected with the Church of Scotland. In that year the different Presbyterian denominations united to form one Presbyterian Church, and the connection with the mother Church at home came to an end. In 1871 there were 1,492,029 Roman Catholics, 544,998 Presbyterians, 494,049 Anglicans, 567,091 Wesleyans and Methodists, 239,343 Baptists, 37,935 Lutherans, and 21,829 Congregationalists. In addition there is the utmost variety of minor sects. In Quebec and Ontario education is regulated by laws specially adapted to the prevailing religious elements. The common schools in the Dominion are supported partly by Government, partly by local rates, and occasionally by the payment of small fees. All common-school teachers are examined by a county board of education before they can claim a Government allowance. The inhabitants of Quebec, who are to the extent of four-fifths descendants of the original settlers, speak the French language.

History.—In 1535 Jacques Cartier discovered the St. Lawrence; and from hearing the Indians make frequent use of the word *Kanata*, a village (hence C.), carried away the impression that the name applied to the whole country. In 1608 Champlain founded Quebec, the first permanent settlement on the St. Lawrence. During 1676 and 1687, La Salle explored Western Canada and the basin of the Mississippi, to which the French therefore naturally laid claim. But the result of the famous war of 1759-60 was the surrender (1763) to Britain of nearly the entire possessions of the French in the New World. At the conclusion of the American War of Independence (1783), Britain lost not only her own revolted colonies, but also that portion of territory W. of the Alleghanies, which she had previously wrested from

France. C. proper was divided into two provinces in 1791. These were reunited in 1840, and were again separated on the establishment of the Confederation in 1867. The Confederation, including also Nova Scotia and New Brunswick, formed the basis of a dominion to which was added, in 1869, the vast territory of the Hudson Bay Company. This acquisition, now known as the province of Manitoba, cost the Canadian Government £300,000. In 1871 the Confederation was augmented by the addition of British Columbia, and in 1873 by that of Prince Edward Island. Provision, as already stated, has been made in the Act of Union for the admission of Newfoundland—the only portion still excluded of British N. America. See De Charlevoix, *Histoire et Description de la Nouvelle France* (3 vols. Par. 1744); M'Gregor, *British America* (2 vols. Lond. 1832); J. MacMullen, *History of C.* (Brockville, 1868), and the works of Brasseur de Bourbourg (1852), J. Hutton (1857), Wilkinson (1861), Hunt (1865), Russell (1865), Kirke (1871), and Marshall (1871).

Canada Balsam is a turpentine obtained by incision of the stem of *Abies balsamea* (Balm of Gilead fir), a native of Canada and the United States. C. B. is obtained chiefly from Canada and the state of Maine. It is contained in receptacles between the bark and wood, and when an incision is made into them, C. B. flows out and is received into bottles. It is imported in barrels, each containing about 1 cwt. C. B. is an oleo-resin of pale yellow colour, of the consistence of thin honey, having a bitter taste and a peculiar odour. By exposure to the air it dries very slowly. It consists chiefly of *Resin* (q. v.), and about 18 per cent. of a volatile oil. It is used in medicine in doses of 20 to 30 grains to check discharges from the mucous surfaces. It is also used for making blistering paper. It is also much used for making varnishes, for cementing glasses by the optician, and for mounting microscopic preparations. C. B. is not a *true* Balsam (q. v.), but a Turpentine (q. v.).

Canada Balsam.

grains to check discharges from the mucous surfaces. It is also used for making blistering paper. It is also much used for making varnishes, for cementing glasses by the optician, and for mounting microscopic preparations. C. B. is not a *true* Balsam (q. v.), but a Turpentine (q. v.).

Canada Goose. See **GOOSE**.

Canada Rice, or Swamp Rice (*Zizania aquatica*), a grass growing on the edges of lakes in Canada and the northern United States. It is collected by the Indians and the backwoods settlers for the sake of the grain, which can be used as food.

Canada Snake-Root, or Wild Ginger, the rhizome of *Aristolochia Canadensis*, a plant belonging to the birthwort order (*Aristolochiaceæ*), used in Canada and the United States as a 'tonic diaphoretic and aromatic stimulant.'

Can'agong, or Pig's Faces (*Mesembryanthemum squarrolatum*), a plant of the order *Mesembryaceæ* (q. v.), the fruit of which is eaten in Australia.

Canal. Strictly speaking, every artificial channel for water may be called a C., but in general the word is restricted to channels constructed for the purpose of navigation. The use of such canals is very ancient; they were constructed by the Egyptians, the Chinese, and probably other Eastern nations, long before the commencement of our era, about which time they seem to have been introduced into Europe, where for many centuries their employment extended very gradually. This slow progress was no doubt greatly owing to their still wanting the crowning improvement necessary to adapt them for routes having great alterations of level—the *lock*. In some of these early canals inclined planes, up which a vessel placed upon a cradle could be hauled, were employed, along with suitable stop-gates, so that they were not necessarily all at one level; but this contrivance, as then used, was very inadequate, and could only be employed to a limited extent. The lock, as now used, was not invented until the 14th c. By its introduction—the credit of which is

claimed both by Italian and by Dutch engineers—the construction of canals for inland navigation received a fresh impetus. It is, in fact, only at this time that the history of modern canals may be said to have commenced. The oldest C. in England was originally a Roman cutting—the Foss Dyke—which extends from Lincoln to the Trent near Torksey, about 11 miles. It was deepened in the time of King Henry I., and again in 1782 by Smeaton, but it remained in a very defective condition until 1840, when the Stevensons of Edinburgh were employed to deepen it to 6 feet, and widen it to 40 feet throughout, and render it thoroughly efficient. In 1868 there were seventy-four canals, of 2431 miles, in England and Wales.

One of the greatest canals upon the Continent was completed as early as 1681. This is the Languedoc C., designed by Riquet to connect the Atlantic with the Mediterranean. It is 148 miles long, rises 600 feet, and has over a hundred locks and fifty aqueducts. It seems strange that the successful execution of so great an undertaking should not have been sufficient to stimulate English engineers to work in the same direction, but it was not until nearly a century later that James Brindley (q. v.), working with the Duke of Bridgewater, fairly started the making of navigable canals in this country, as he really did in making the Bridgewater C. from Worsley to Salford in Lancashire. After this time (the Bridgewater C. Act was obtained in 1759), the construction of navigable canals occupied the attention of all the great English engineers—Smeaton, Watt, Rennie, Telford, and many others—for many years; indeed, until the railways superseded every other means of locomotion. It is not likely that canals will be ever again made in this country, nor indeed elsewhere, except under such conditions as those of the Suez C., where the object is to shorten very greatly the voyages of ships.

In constructing a C., the engineer has first to look to the means of obtaining sufficient water to keep the C. filled, and in default of a natural reservoir an artificial one must be constructed for this purpose. He must also provide waste-weirs for the discharge of surplus waters in floods, and discharge-slues for emptying the C. for repairs. For this purpose it is best to provide stop-gates which can divide the whole C. into short sections of a few miles, so that it may not be necessary to empty a long reach for the sake of repairing some local fault. It is generally best, where practicable, to place a number of locks together, rather than to distribute them over the length of the C. Inclined planes have often been used instead of locks where some very great difference of level has to be surmounted, the objection to locks being the time and labour unavoidably spent in getting through them. In these cases the vessel is floated on to a carriage and steadied there, and carriage and vessel are then hauled up an incline of about 1 in 10 by steam or water power. Perpendicular lifts have occasionally been used also for this purpose.

Among the greatest canals now in use are the following:—The Great N. Holland C. (designed by M. Blanken), completed in 1825, and extending from Amsterdam to the Helder, 51 miles long, 125 ft. broad at the water-level, 31 ft. at the bottom, and 20 ft. deep; the Caledonian C. (q. v.); the Morris C., connecting the Hudson and Delaware rivers, 101 miles long, and having a rise and fall of 1557 ft., mostly arranged with inclined planes; the Forth and Clyde C., 45 miles long, 27 ft. wide at bottom, and 9 ft. deep, with 155 ft. rise, &c. Among the principal English canals for the conveyance of barges only (and therefore much shallower than the preceding) are the Leeds and Liverpool C., 128 miles long, 433 ft. rise; the Trent and Mersey C., 93 miles long and 326 ft. rise, &c.

The greatest C. in existence is that connecting the Mediterranean and the Red Sea, for which see **SUEZ CANAL**.

Canale, Antonio, usually called **Canaletto**, an Italian painter, born at Venice, 18th October 1697. His father was a scene-painter, and he himself for a time followed that occupation. Removing to Rome, he assiduously studied from nature, and on his return to Venice painted its picturesque palaces, churches, and canals with wonderful fidelity and brightness. C. died 20th August 1768. His almost innumerable works are to be seen in all the galleries of Europe; but the finest of them, 'The View on the Grand Canal, Venice,' is in the Museum of the Louvre.—His nephew and pupil, **Bernardo Bellotto O. or Canaletto**, born at Venice in 1724, died at Warsaw in 1780. After painting for a time at Venice, he travelled to Rome,

Verona, Brescia, Milan, and Dresden, where he was admitted member of the Academy. He afterwards sojourned in London, where he painted an interior of King's College Chapel for Horace Walpole. Knowledge of perspective and accuracy and vigour of drawing, especially in giving effects of light, are his chief merits, as they were also those of his uncle.

Canals, Intercellular. In most cases cells are united to the contiguous ones so closely as to leave no appreciable spaces between them (the 'perfect parenchyma' of Schleiden), yet in various plants the cells only touch each other at one or two points, leaving, as in the green pulpy parenchyma, spaces between them, known as I. C. In shape they vary much. Most probably they only contain air.

Canami'na, a small town in the kingdom of Dahomey, Africa, Guinea-Coast, lies 13 miles S. of Abomey, on the direct road to the shore. Pop. 10,000. A house here is devoted by the king to the use of white travellers.

Cananore, a town of British India, province of Madras, on the Malabar coast, 50 miles N.N.W. of Calicut, and 100 S.W. of Seringapatam. It has cantonments, and does an active export trade in timber, grain, pepper, and cocoa-nuts. C. was captured by General Abercromby from Tippoo Sultan in 1791. Pop. 15,000.

Canarac, a town of British India, province of Bengal, division of Orissa, and district of Pooree, on the Bay of Bengal, has remains of a gigantic pagoda, now in great part removed to the Temple of Juggernaut. The pagoda is estimated to have covered 13 acres, and some of the blocks are 15 feet long and 8 broad, consisting mainly of black basalt and granite.

Canarose. See DRAVIDIC LANGUAGES.

Canaries, or Canary Islands, a group of seven Spanish islands, and of several rocky islets, in the Atlantic, off the coast of Africa, lat. 27° 40'–29° 25' N., long. 13° 25'–18° 16' W. They are Hierro or Ferro, Palma, Gomera, Tenerife, Gran Canaria, Fuerte Ventura, and Lanzarote. Gracioso and Alegranza are the largest of the islets. Area, 2810 sq. miles; pop. (1870) 283,859. The islands are of volcanic origin, with steep and rugged coasts, while the surface is partly mountainous, the *Pico de Teide* (Peak of Tenerife) rising to the height of 12,182 feet. Streams are numerous, but there are no rivers of any note. The climate is generally healthy, the temperature ranging from 87° F. in October to 60° F. in January. Vegetation, both tropical and European, is luxuriant in the valleys where there is sufficient moisture, but the S.E. wind (El Levante), blowing in November and February, or at the beginning and end of the rainy season, is dry and parching. The wine trade, formerly extensive, was nearly annihilated by the drought (*oidium*) of 1864, but the *opuntia* cactus has been extensively cultivated on the desolated vineyards, and cochineal is now exported largely. In addition to this there are exports of cereals, raw silk, tobacco. The imports are woollen and cotton cloths, cutlery, glass, hardware, olive oil, and wine. In 1874 the former amounted to £596,244 and the latter to £511,936. There are many regular lines between London, the Morocco ports, and the C., while the Liverpool mail-steamers to the African coast touch at Santa Cruz, Tenerife. There is a captain-general over the whole group, and each of the islands has a subordinate governor. The C. are supposed to be the Fortunate Islands of the ancients. Juba II., Prince of the Mauritania, wrote a description of them, preserved by Pliny; and Ptolemy fixed his first meridian in the group. They were visited in the 14th c., but it was not till the following century that the Spaniards got possession of the islands, which then received their present name, because they abounded in wild dogs. After some disputes between the Spanish and Portuguese as to the possession of the C., the supremacy of Spain was established in 1493, and has been maintained ever since. The aboriginal Guanches, a superior race, who embalmed their dead, have long since disappeared as a separate people.

Canarium, a genus of plants of the natural order *Amaryllidaceae*, natives of the south-eastern parts of Asia and of the Malay Archipelago. The kernel of the fruit—a triangular drupe—of *C. commune*, which is cultivated in the Moluccas, is eaten, both raw and roasted, and an oil expressed from it is used at table when fresh, and for burning in lamps. The gum which exudes

from the bark is said to be like the balsam of Copaiba (q. v.). In Amboyna, bread is made of it. *C. sylvestre* also produces fruit, the kernels of which are eaten. *C. strictum*, of Malabar, produces the 'Black Dammar' resin. *C. microcarpum* also yields an oil like copaiba, used in shipbuilding yards under the name of DAMMAR (q. v.). *C. commune*, among other trees, is believed to yield ELEM (q. v.).

Canary Bird, an insectivorous bird allied to the Finches (q. v.), and generally included in the sub-family of *Fringillina* or true finches. The familiar domesticated canary differs in colour and other respects from the wild birds, which are greyish or greenish yellow in hue. Domestication has tended to improve the general appearance and the song-notes of these birds, although Heineker says their song, even in the wild state, is very clear and beautiful. They derive their name from their inhabiting the Canary Islands. The nest is built of roots, moss, and feathers, and from four to six eggs are laid, of a pale-blue colour. They breed from four to six times in the season, and propagate in confinement; feed upon seeds, also grasses and the leaves of various weeds and plants. They were first brought to Europe about the beginning of the 16th c. The inhabitants of the Tyrol, and other parts of the Continent, are largely engaged in breeding and in training these and other birds to sing. The canary will interbreed with other species of finches, and the hybrid progeny or 'mules' frequently possess excellent voices.

Canary.

Canary Seed, the grain of *Phalaris Canariensis*, much used as a food for canaries, and other small domesticated birds. It is a native of the Canary Islands, but now naturalised in the S. of Europe, and in Britain and Germany, where it is cultivated. Essex and Kent are in England the chief localities where it is grown for the sake of the seed, as an article of trade, and for the purpose of preparing a fine flour from it used in finishing silk fabrics, and in dressing the finer cotton webs. In Italy, the Canaries, and Barbary it is made into a nutritious bread. *Phalaris arundinacea* is a tall, reed-looking grass, growing very commonly about the edges of lakes, marshes, rivers, and other wet places in Britain and Southern and Central Europe. *Gardener's garters*, *ribbon grass*, or *ladies' traces*, is a variety with striped leaves, well known as a garden plant. The wild plant is sometimes useful for feeding cattle, especially if cut early.

Canary Wine. The wines produced in the Canary Islands have the same character as the celebrated vintages of Madeira, for which they are sometimes substituted; but they are much inferior in quality. Indeed, the best-known C. W. is named Bastard Madeira, or Tenerife. The imports at one time from the Canary Islands into Britain were considerable, but towards the end of last century they fell away, and have not revived to any great extent.

Canaster (Span. *canasto*, 'a basket'), a rush hamper or basket in which tobacco is packed in S. America; hence a name for a kind of tobacco.

Canavalia, a genus of plants of the order *Leguminosae*. About twelve species are known, mostly shrubby climbing plants. *C. gladiata*, of the W. and E. Indies, Mexico, tropical Africa, Brazil, &c., is called the 'Overlook' by the W. Indian negroes, who plant it on the edges of their 'provision grounds,' under the belief that it exercises some mysterious power in watching or protecting their property from being plundered.

Can'celling, in law, signifies the making of a deed or other legal instrument void by drawing lines in ink over it, with consent of parties interested. A will may be so revoked, if it appear that the lines were drawn with the intention of revocation. But a cancelled writing may be produced as evidence. In Scotland, the system of registration of legal instruments greatly prevents disputes owing to their being lost or cancelled, and when necessary to know or have proof of the contents of a lost or mutilated paper, this may be arrived at and judicially declared by an

action for proving the tenor. (See TENOR, 'PROVING OF.') In England, the same result may be arrived at in a court of equity. The origin of the word *cancel* is the Lat. *cancelli* ('lattice-work'). As early as the time of Ulpian the verb *cancellare* had acquired the meaning to cross out a writing in the form of lattice-work (+).

Cancelling of Letters Patent. Letters patent, when contrary to law, may be cancelled by the Lord Chancellor. See LETTERS PATENT.

Cancer is one of the most painful and fatal diseases to which man is liable. It is essentially a constitutional disease, characterised by a local manifestation the aspect of which has given rise to the name. C. may occur in almost any organ of the body. It is prone to occur in the female breast and uterus, and for this reason it is much more common in females than in men. It seldom attacks a person under forty-five years of age. On examining C. microscopically, it is found to consist of numerous cells of various forms. These cells are nucleated, and some have several nuclei within one cell. They may form a distinct tumour, or may be infiltrated among the natural tissues of the body. As the cells are abundantly provided with nuclei, they multiply rapidly. A cancerous tumour, wherever situated, is called by the surgeon a malignant tumour. The characteristics of such a tumour are its rapid growth, its undefined outline, its tendency to involve neighbouring parts in its own peculiar structure, and to spread along the lymphatics, enlarging all the glands in its neighbourhood, its peculiar, sharp, darting, lancinating pain, often compared to that of needles darting through the tumour, and the impossibility of getting the wound to heal after the skin is broken. The discharge from a cancerous tumour is often very fetid, and frequently mixed with blood. The general appearance of the patient is very characteristic. The skin is of a dirty yellow hue. The features express great anxiety and distress—an expression of countenance difficult to describe, but not readily forgotten. There is great wasting of the whole body and general debility. See CACHEXIA. The chief kinds of C. are:—

1. *Scirrhus* or *Hard C.*—This is a very common form of C., but is seldom seen in persons under forty years of age, and generally in more advanced life. It is specially common in females; the most frequent site of this kind of C. is the female breast. It is also found in the male genital organs—the uterus, the skin, and mucous membrane. When *hard C.* attacks the female breast, it begins as a small *hard* tumour, at first movable, but soon becomes adherent to adjacent tissues, with sharp shooting pains; the breast often becomes smaller from the contraction of the tumour, the nipple is frequently drawn in, and the skin becomes fixed to the hard mass, the glands in the arm-pit become swollen and painful, and in course of time the Tumour (q. v.) opens and discharges fetid matter. When *hard C.* is removed by excision, it is found to be very hard and heavy; when cut with a knife it makes a sound as if cutting a raw potato. The two cut surfaces retract so as to become concave.

2. *Epithelial C.*, or *Epithelioma*, is the kind generally seen on the lower lip. It also attacks the tongue, the cheeks, the hands, and other parts. It may occur wherever there is skin or mucous membrane.

3. *Soft C.*, or *Medullary C.*, so called from its resemblance to brain substance. It has other names, all derived from the fact that it resembles in colour, consistence, and texture the brain. This kind is very vascular, and very rapid in its growth. Those who suffer from it seldom survive two years, and the great majority not half that time. It is full of a semi-liquid substance called '*C. juice*.' Microscopically it consists of cells like those of *hard C.* This form is the kind found in young children, and though it may occur at any period of life, even in extreme old age, yet it is most common in the young. It may also occur in any texture, but is most frequently found in bones, the eye, the testicle, and internal viscera. The form known as *Chimney-sweeper's C.* is a variety of soft C., so is the form called *Fungus hæmatoides*. Another kind of C. is called *Colloid C.* from its resemblance to *glue*. It occurs most frequently in the internal organs.

Not much requires to be said regarding the treatment of C. When the disease is situated in a part or organ that can be cut out by the knife of the surgeon, the operation ought to be performed as soon as the real nature of the disease is recognised. Patients have frequently regretted, when too late, that they re-

fused to allow the surgeon to remove a C. in the early stage of the disease. When the part cannot be excised, treatment consists in giving opiates to relieve pain, checking hæmorrhage by Styptics (q. v.), as perchloride of iron, and applying soothing and disinfecting poultices to the parts affected, as hemlock leaves and charcoal. Attention must be paid to the general health; good nourishment and stimulants should be administered when the patient is weak. Nothing affects the mind of a patient more than the dread of C. Hence the necessity for early seeking the best medical advice, and acting up to the instructions of the surgeon. The so-called C. curers, of whom so much is heard in the present day, live to a great extent by working on the fears of the people—making many believe they have C. when no C. exists, and representing others as cured when the diseased part has only been made worse than before. We hear much of such people extracting C. by the '*roots*,' and actually showing these '*roots*' to their patients; the fact being, that a strong caustic, such as sulphuric acid, has been applied, the charred mass has sloughed out, and the deepest parts of the slough are represented as the C. *roots*. Nothing is known regarding the origin of C. Science can easily explain how the cells multiply when once the first are formed, but what gives rise to these first cells is still a mystery. C. is essentially a constitutional disease; it is therefore liable to be transmitted from parent to child. It also exists in some of the lower animals, although it is much more common in the human subject.

Cancer, one of the signs of the zodiac, symbol ☌, occupies a place in the ecliptic between 90° and 120° from the vernal equinox. The constellation of the same name, originally coinciding with the sign, but now no longer so on account of precession, is situated between the Twins and the Lion, but contains no star brighter than the third magnitude.

Cancer-Root, or **Beech-Drops**, the popular name in America for *Epiphegus* and *Conopholis*, as well as for *Anoplantus* (*Aphyllon*) *uniflorus*, and *Phelipæa biflora*. Usually it is applied to *Epiphegus Virginianus*, a parasitic plant of the natural order *Orobanchaceæ*, growing in the exposed roots of beech-trees, hence its popular name of beech-drops. The name of C.-R. is derived from a popular idea of its efficacy in the cure of cancer, applied both externally and internally. Its medicinal properties are in all probability imaginary, though several other plants of the same order bear a similar reputation—e.g., an infusion of the common broomrape (*Orobanche major*) is applied as a cleansing lotion to foul sores.

Cancer, Tropic of. See TROPICS.

Cancrum O'ris, a corroding ulcer of the mouth, occurring in weak, delicate young children from two to six years of age. It may arise after some exhausting disease, or in children badly nourished. It has been variously named *gangrenous stomatitis*, or sloughing phagedæna of the mouth. C. O. is characterised by swollen gums, hard swollen cheek, with white patches on the inside of the affected part. A slough is soon formed, and much of the gums, cheek, and lips slough off. There is a flow of saliva, with a very offensive breath. It is accompanied with great constitutional disturbance, and sometimes the whole side of the face sloughs off, and the patient dies exhausted. The proper treatment of the disease consists in applying a strong caustic, as nitric acid, to destroy the unhealthy textures, and in giving tonics and good nourishing diet internally. Preparations of iron and quinine, with cod-liver oil, are the most beneficial. To destroy or diminish the offensive odour from the mouth, gargles of chlorine water, Condy's fluid, or charcoal should be used.

Candahar, or **Kandahar**, a town of Afghanistan, and capital of a province of the same name, lies between the Argandab and Tarnak rivers, 380 miles S.E. of Herat. It is surrounded by a deep ditch and a mud wall in which there are six gates, and from four of these run the principal streets, about 40 yards wide, lined with shops and houses. These streets intersect C. at right angles, and at the point of meeting there is a large dome (*Charsu*) 50 yards in diameter. The town is divided into quarters, separating the different tribes and even trades, while the houses are flat-roofed, and are built of sun-dried bricks. Those of the rich are enclosed by high walls, and contain three or four courts, with gardens and fountains. C. is defended by

a citadel at its N. end, occupying the Topkhana, an open space of 196 sq. feet. To the W. lies the tomb of Almad Shah Durani, an octagonal structure of coloured porcelain bricks, surrounded by a gilded dome, which rises conspicuously above the city. The wealthiest merchants of C. are Hindus, who carry on an active trade with Bombay, *via* Shikarpur and Karachi, importing indigo, spices, sugar, calicoes, medicines, &c.; and exporting madder, assafetida, wool, dried fruits, tobacco, raw silk, rosaries, &c. The trade with Herat and Mashar is carried on by Persians, dealing chiefly in raw silk, precious stones (turquoise), carpets, weapons, brocade, and silver-braiding. The vine is extensively cultivated in suburban gardens. The chief manufactures are silks, and rosaries of crystallised silicate of magnesia. C. is supplied with water by a canal from the Argandab, but the water is polluted in the streets. The climate is delightful in winter, but extremely hot in summer, the temperature at this season reaching 150° F. Pop. 80,000. The old city of C. (*Shar-i-Kohna*) lay four miles to the W., where still are seen its ruined defences and reservoirs. It is said to have been founded by Alexander the Great, and to have been often destroyed and rebuilt by its Arab, Persian, Tartar, Turkoman, and Usbeg conquerors. In 1738 it was finally sacked by Nadir Shah, who removed its site two miles S.E. and called the new city *Nadirabad*. It was scarcely built, however, before it was destroyed by Ahmed Shah Abdali, who founded the present city in 1747. C. was held by the English during the Afghan war from 1839 till 1843.—The province of C. lies in the S. of Afghanistan, is celebrated for its fruits, and produces abundance of wheat, barley, madder, maize, rice, beans, tobacco, beetroot, musk, &c. See Bellew, *General Report of Kandahar Mission* (1871).

Candelab'rum (Lat.), an instrument used by the ancients to support a lamp. In its simplest form a C. consisted of three parts—a slender *shaft*, resting usually on a *tripod* formed of animals' feet, with a *plinth* carrying a circular plate on which the light was placed. The shaft was originally formed of cane, and afterwards, when metal was employed, the slender cane form was retained, and frequently enriched with leaves and other ornaments. Sometimes the shaft was constructed in a telescopic fashion, to be shortened or lengthened at pleasure. Many portable lamp-stands of bronze, exhibiting graceful form and rich ornamentation, have been discovered at Herculaneum and Pompeii. Numerous examples of Greek and Roman candelabra are preserved in the British Museum, the Louvre, and the Vatican. The last named is exceptionally rich in large antique candelabra of carved marble, with ornaments in bold relief, which were placed in temples for burning incense. In another form of C. a number of lamps were suspended from the branching arms of a pillar.

Can'dia. See CRETE.

Can'didate (Lat. *candidatus*, 'clad in white') denoted among the Romans an applicant for any public office, because he went about on his canvass (*ambitio*) of the electors adorned with a white or shining toga. In the early Christian Church the name of C. was given to a newly-baptized convert, from the white robe, indicative of purity, and also perhaps of freedom, with which he was decorated. In modern times the word C. has come to denote an aspirant to any office whatever, and has therefore partly gone back to its pre-Christian usage.

Candle, an artificial source of light, in the form of a long thin cylinder, or slightly conical rod, composed of fatty substances, enclosing a wick of cotton rovings twisted or plaited together. Ancient Roman candles consisted of the pith of a kind of rush surrounded with tallow or wax. In England, during the Anglo-Saxon period, ordinary candles were merely masses of fat plastered round splinters of wood. A generation ago, tallow formed the chief material employed in making candles; the recent improvements, however, in the C.-making industry have, to a large extent, displaced it, and it is now only used for the commonest forms of C. Candles are made by two processes, *dipping* and *moulding*, but chiefly the latter, and when well-made they are white, hard, glossy, dry, and not greasy to the touch.

Dipping is made by stringing a number of twisted wicks upon a rod, and dipping repeatedly into a trough of melted tallow, allowing the dip to solidify after each immersion. Dipping is continued till the candles have attained the requisite thickness.

Moulds are made with moulds of thin pewter or glass, slightly tapering, which are arranged in a wooden frame with the narrow ends, which shape the points of the candles, downwards. The wicks are stretched along the axes of the moulds by means of wires, and the melted fat is then run into the moulds. Next day the candles are withdrawn, cut and trimmed at the base, and stored for use. In large manufactories, machinery is employed in moulding as well as in dipping. Before use the tallow is purified by mechanical or chemical means of its fibrous tissue and other extraneous matter.

Wax candles are seldom moulded, on account of their adhesion to the moulds, and contraction in cooling. A different method of manufacture, termed *basting*, is accordingly resorted to. It consists of pouring the wax over a series of wicks suspended from a ring of wood or metal rotating horizontally over a caldron. When the candles are about one-third of their ultimate thickness, they are rolled between marble or boxwood slabs into a smooth cylindrical form; these operations of basting and rolling are repeated as often as is necessary, and the candles finished by trimming with a knife. Wax candles, for household use, have been superseded by other kinds about to be described, but they are still employed in the Roman Catholic and Greek churches as indispensable accessories of the altar. Russian wax candles are remarkable for their beauty, elegant form, and gilt decoration.

Sperm candles, the old rivals of the wax kind, still retain their hold upon the market, and are composed of *spermaceti*, obtained from the brain of a species of whale, mixed with a little bees-wax.

Palm and cocoa-nut oils are now extensively used in C.-making, and the enormous development of late years of this industry is to be attributed to the successful separation of stearic and palmitic acids from animal and vegetable fats. Natural fats are mixtures of either of two substances, solid at ordinary temperatures, called *stearine* and *palmitin*, or of both, in a fluid constituent, termed *olein*. Each of these, again, contains an acid, called respectively stearic, palmitic, and oleic acids, in combination with a liquid organic base called *glycerine*, which can be easily removed by saponifying the fats with caustic alkalies, as in the process of soap-making. See SOAP.

'Stearine' candles.—The stearic acid which abounds in animal fats, as beef and mutton suet, lard, &c., and in cocoa-nut oil, is the material of which these candles are made. Several processes are adopted for its separation. One method is to mix the fat with lime, which results in the formation of a stearate of lime and free glycerine; the lime-soap is then decomposed by sulphuric acid, which unites with the lime; the liberated fatty acids, rising to the surface, are removed and washed with diluted sulphuric acid and afterwards with water, and finally the fluid oleic acid is forced out by powerful hydraulic pressure. In moulding the stearic acid thus obtained, care has to be taken to regulate its temperature to prevent crystallisation. Stearic acid is also obtained from stearine by distillation under pressure of superheated steam.

'Belmont Sperm' candles are made chiefly from palmitic acid obtained from palmitin, the principal ingredient in Palm Oil (q. v.). A distinct method of treatment is followed in operating with palm oil. The fat is raised to a high temperature, mixed with one-twentieth of its weight of sulphuric acid; lime is added to neutralise the acid, and on distilling the product glycerine passes over first. Chinese vegetable tallow, obtained from the fruit of *Stillingia sebifera*, and Japanese vegetable wax, the produce of *Rhus succedanea*, are mainly composed of palmitin, and are imported into Britain in considerable quantities for candle-making.

'Composite' candles vary in composition. A beautiful transparent kind is made with nine-tenths of stearic acid and one-tenth of bees-wax; another variety is formed of the stearic acid of tallow with the stearine of cocoa-nut oil.

'Paraffin candles.—The manufacture of these candles is now carried on on a most extensive scale in many parts of the United Kingdom from paraffin, procured from bituminous shale, Rangoon petroleum, and other mineral substances. They are much in demand on account of their cheapness and the clearness and brilliancy of their light. The beautiful translucent 'Ozokerite' candles of Messrs Field & Co., Lambeth, introduced in 1870, are manufactured from refined paraffin obtained from Ozokerite. The same firm has recently introduced 'self-fitting' candles,

graduated and grooved at the lower end, adapted to fit any size of candlestick.

The largest C.-making works in the world are those of Price's Patent G. Co., Vauxhall, London.

Candleberry, Candleberry Myrtle, Wax-Tree, Wax-Myrtle, Tallow-Tree, or Baberry, names all applied to *Myrica cerifera*, a shrub, a native of the United States, belonging to the order *Myricaceae*. The fruits—drupes, though generally called berries—when ripe are covered with a greenish-white wax, which is collected by boiling them and afterwards skimming it off the surface when melted. About four or five pounds weight of berries will yield a pound of wax, which is used chiefly in making candles, which yield a pleasant odour, but little light. Scented soap is also made from it. Candles are also manufactured from the wax of the fruits of *M. cordifolia*, the wax-shrub of the Cape of Good Hope.

Candle-Fish (*Thaleichthys Pacificus*), a genus of Teleostean fishes belonging to the Salmon family (*Salmonidae*), and so named from the great amount of fatty or adipose tissue they contain. The C.-F. occurs off the Pacific coast of America, and does not appear to leave salt waters to spawn like its salmon allies. Its average size is that of a smelt or herring. The head is sharp; teeth are borne in the upper parts of the mouth only; the colour being greenish above and yellowish or greyish-yellow below. The flesh is eaten by the Indians, who, however, chiefly use the fish as a ready source for obtaining oil. Like the Shetlanders, who use the shell of the common whelk as a lamp, the Indians often use this fish to give light, by the simple process of drawing a pith wick through the oily body, and allowing the fish to burn away.

Candlemas, the festival of the Purification of the Virgin, is celebrated annually on the 2d of February. The popular name, 'Candle Mass,' is derived from the chief feature in the observance—the priest's blessing of the candles, which are afterwards carried in procession by the people. It is a principal feast in the Roman Catholic Church, and is still observed as a holiday by the Church of England. It has been conjectured that C. was substituted for an original heathen ceremony, the festival of Februs, which was accompanied by an offering of candles, and a lustration of the people. In the Christian observance, the lighting of candles is intended to commemorate the words of St Simeon, when he said that Christ was 'a light to lighten the Gentiles.' Hence C. is also sometimes called the Holiday of St Simeon.

In Scotland, C. is one of the four Term-Days (q. v.), and various popular superstitions and customs are associated with it. In most countries of Christendom, good weather at C. was believed to prognosticate a bad year, and *vice versa*. This notion is embodied in the Scottish quatrain—

'Gin Candlemas day be dry an' fair,
The half o' winter's to come an' mair;
Gin Candlemas day be wet and foul,
The half o' winter's gane at Yule.'

A football match, called *C. Ba'*, was formerly played through the streets of Scotch country towns on this day, and in some places this practice is still continued.

Candle-Nuts, the fruit of the candlenut-tree (*Aleurites triloba*), a species of the natural order *Euphorbiaceae*, a native of the Society Islands, Moluccas, &c. The oil expressed from the seed is called *Kukui* or *Kekuni*, and is largely employed as an artist's oil, and for other purposes. In its action it resembles castor oil.

Candlestick, an instrument for supporting a candle. The brass candlesticks now in common use may be traced back to the 15th c., when a fine kind of brass called *latten* was employed for like purposes. The spiked C., then in vogue, was in the following c. superseded by the prototype of the modern socket C. In churches, in mediæval times, the typical Paschal candle was often borne aloft in a C. of colossal proportions with rich ornamentation. The C. at Canterbury in the 15th c. weighed 300 lbs., and at Durham a large latten C. was decorated with figures of the Evangelists, knights, flying dragons, and other animals.

Candle-Tree (*Parmentiera cerifera*), a tree of the natural order *Crascentiaceae*, the fruits of which are shaped like a candle (hence the name), and are devoured by cattle in the Isthmus of Panama.

Candlewood, a name applied in Jamaica to *Gomphia Guianensis*, also to *Sciadophyllum capitatum* and *Amyris balsamifera*, or the white and black C.

Can'dlish, Robert Smith, D.D., a Scottish divine and ecclesiastical leader, born at Edinburgh, March 23, 1807, educated at Glasgow University, and was for some time a private tutor at Eton. In 1828 he was licensed to preach by the Presbytery of Glasgow, and in 1831 was called to Bonhill. In 1834 he was transferred to St George's, Edinburgh, and subsequently took a powerful part in the discussion of the Church's 'spiritual independence.' By his attitude on this question he forfeited an appointment to the newly instituted chair of Biblical Criticism in Edinburgh University. His nimble intellect, fiery eloquence, and restless energy found, however, a more appropriate sphere of activity in the non-intrusion controversy. All through his public career, from its commencement to its close, he was distinguished alike for his rapid dexterity of argument and great business capacity. 'The first effort,' says Dr Buchanan, 'found him abreast of the most practised and powerful orators, and as much at home in the management of affairs as those who had made this the study of their life.' A strict Calvinist in doctrine, his preaching was at once fervent and subtle. In 1861 he was elected Moderator of the Free Church Assembly, and in the following year was appointed Principal of the Edinburgh New College. He died 19th October 1873. C.'s principal writings, which are more or less of a popular character, are *Contributions towards the Exposition of the Book of Genesis, Life in a Risen Saviour, The Fatherhood of God, and Scripture Characters and Miscellanies*.

Can'dys, a Greek word meaning a loose woollen upper garment with wide sleeves, worn by the ancient Medes and Persians, and similar to a gown still worn by Turks and Arabians. It was always dyed in some brilliant colour, such as purple.

Can'dy-Sugar is sugar crystallised in sticks from its strong solution. The crystals are usually clustered around bits of twine or thin slips of wood. The name is probably derived from the island of *Candia*. At any rate, *kand* is the Turkish name for sugar of every kind.

Can'dy-tuft, the gardener's name for various species of *Iberis* (natural order *Cruciferae*), chiefly natives of the Mediterranean countries. *I. umbella* is the white and purple C., *I. odorata* the sweet-scented C., and *I. sempervirens* and *I. sempervirens* are two semi-shrubby species; all are common garden plants.

Cane, a commercial name applied to any smooth, more or less flexible, rod of wood about the thickness of a walking-stick, though generally applied to thin palms, &c. The following are among the more common species to which the term C. is applied:—Bamboo C. (*Bambusa arundinacea*, q. v.), dumb C. (*Dieffenbachia seguina*), great rattan (*Calamus rudentum*), ground rattan (*Rhapis flabelliformis*), Malacca C. (*Calamus seipionum*), Rattan (q. v.) (*Calamus Rotang*, *C. Royleanus*, *C. Roxburghii*, &c.), sweet C. (*Andropogon Calamus aromaticus*, q. v.), Sugar C. (q. v.) (*Saccharum officinarum*), Tobago C. (*Bactris Minor*, stems used for making walking-sticks), Imphee C. (*Sorghum saccharatum*, q. v.), snake-C. (*Kunthia montana*), Whangee C. (*Phyllostachys nigra*), wild C. (*Arundo occidentalis* and *A. saccharoides*), &c.

Canea, or **Cana** (the ancient *Cydonia*, mod. Gr. *Khania*, Turk. *Hanie*), is the capital of the island of Crete or *Candia*, lies on the N. coast, and has an active export trade in olive oil, Valonea nuts, locust beans, silk cocoons, &c. It is the residence of a Greek bishop, and of the governor of the island, of which it is the principal haven. Greek is the dominant language. Pop. 12,000. The present town was built by a Venetian colony in 1252, during the Latin rule at Constantinople (see *BYZANTINE EMPIRE*), and was fortified with the view of keeping in check the mutinous Greeks.

Cane-Brake, an American term applied to *Arundinaria macrosperma*, a grass which grows in marshy places in the warmer portions of the United States.

Canell's Bark has been confounded with Winter's bark, hence it is sometimes called *spurious Winter's bark*. It is a native of the W. Indies. The bark is pale-orange coloured, with an aromatic odour, and is used as a tonic, and in America

as an anti-scorbutic. Among the W. India negroes, and also in some portions of Europe, it is used as a spice. It yields a volatile oil which is sometimes mixed with or substituted for oil of cloves. In commerce it is known as *wild* or *white cinnamon*, or *white-wood bark*, and is exported from the Bahamas.

Canella, *oese*, a natural order of Dicotyledoneous plants, containing only three species, natives of the W. Indies and the adjoining continent of America. They are aromatic, stimulant, and tonic. *Canella-alba*, the laurel-leaved C., or wild cinnamon, &c. *Cinnamodendron axillare*, *C. corticosum*, a native of Jamaica, &c., have also aromatic bark similar in properties to *C. alba*. *C. corticosum* yields 'Winter's bark' as now found in commerce.

Cane-Sugar. See SUGAR.

Cannes Venatici ('the hounds'), a constellation in the northern hemisphere, added by Hevelius, who named the two dogs which represent it Asterion and Chara.

Cang, or **Caque**, called also **Kee**, a Chinese instrument of punishment, consisting of a wooden collar of from fifty to sixty pounds weight, which is fixed round the neck of the culprit, who is first marched through certain streets by the police, and then left exposed in some public place. The term of his sentence, which sometimes extends to fifteen days, is written on slips of paper, pasted up on the parts to which the C. is fastened, and sealed by the mandarin, so that no one dares to relieve him till the time has expired. Meanwhile the prisoner has to be fed by others, as he cannot use his hands.

Cangas de Oñis, a town of Spain, province of Oviedo (Old Asturias), 35 miles E. of the town of Oviedo. Pop. 7000. Near it is the cave where, according to Spanish legend, Pelayo hid after his defeat by the Arabs in 711 at Guadalete, and whence he issued seven years later, and completely vanquished his conquerors.

Canicatt'i, a well-built town of Sicily, province of Girgenti, on the Naro, 15 miles N.E. of the town of Girgenti. There are sulphur mines in its neighbourhood. Pop. (1871) 20,908.

Canicular Days, or **Dog Days**, the name given to certain days of the year, which are usually set down as beginning on July 3 and ending on August 11, and which are characterised by excessive sultry heat. In the time of the ancient astronomers, the heliacal rising of Sirius, the Dog-star (hence the name), occurred in the beginning of July, and to it all the disagreeable accompaniments of hot weather were superstitiously ascribed.

Canidae, the *dog* family of the *Carnivorous* order of mammalia; represented also by the wolves, foxes, and jackals. The family is distinguished by its members possessing pointed muzzles, smooth tongues, and claws incapable of retraction as in the Felidae or cats. The front feet are five-toed, the hind feet being four-toed. The molar teeth may number $\frac{6-6}{7-7}$ or $\frac{7-7}{7-7}$, and two or three on each side of each jaw are tuberculate. The 600

claws and flesh teeth possess large processes. The diet of these animals is less wholly or particularly *carnivorous* than in the Felidae. (See also DOG, FOX, JACKAL, WOLF, &c.).

Canis Major and Minor, two contiguous constellations, the former in the southern, and the latter in the northern hemisphere. They contain respectively the bright conspicuous stars, Sirius (q. v.) and Procyon (q. v.), and may be found by means of these.

Canister Shot. See CASE SHOT.

Canker, a disease resulting in the slow decay of trees attacked by it. It is a kind of gangrene, proceeding from the roots slowly upward, and killing the tree in the course of a few years. It is especially fatal to fruit trees. Wet soils are inductive of C., and it also attacks twigs injured by frost. It is of various kinds, and the same tree may exhibit several different kinds of C. The woolly aphid, the development of bundles of adventitious roots, &c., may be all seen at one and the same time on the same plant. Trees long propagated by grafting are liable to it. The C. of the plum and the apricot are brought on by 'gumming.' Mr Berkley thinks that in many cases C. arises from the roots of the tree 'penetrating into uncongenial soil, which vitiates the juices, and induces death to the weaker cells, from which it spreads to the surrounding tissues; the rugged appearance being due to a struggle between the vital powers of the plant and the diseased action.'

Canker, a disease observed in the foot of horses, and characterised by a purulent discharge from the 'frog' or 'heels,' by ulceration and disintegration of the hoof and other structures of the foot, and latterly by the presence of raw and bleeding granulations. The exact nature of this affection still forms a subject of dispute amongst veterinarians; but the appearances and symptoms would lead the pathologist to refer it to the class of ulcerative and inflammatory affections, with probably a tendency in some constitutions to merge into a cancerous type. Sometimes the disease appears to be congenital in its nature, and the latter fact would seem to favour the idea of its cancerous nature or relations. It is caused by whatever tends to lower the system of the horse, by cold and damp; or it may (although more rarely) appear after some injury to the foot. Low-bred horses appear to be mostly subject to this disease. The *treatment* consists in that adopted for the cure of ordinary ulceration. The parts affected are to be pared away or to be removed by caustics. Pressure and protection by means of pads of tow, are to be applied to restrain the process of granulation. Purgatives are to be administered, and during convalescence, good feeding, pure air and exercise, are recommended.

Cann'a, an islet in the group of the Hebrides, included in Argyleshire, with a pop. (1871) of 48. It lies 7 miles S.W. of Skye, and extends from E. to W.; is 1 mile broad, and $4\frac{1}{2}$ miles long. It rises high above the sea, is mainly formed of trap, and has a basaltic eminence, Compass Hill, so called because it reverses the magnetic needle.
